

Figure S2B. *In vivo* establishment and control of Fusarium wilt disease of chickpea caused by *Fusarium oxysporum* sp. f. *ciceris* by the bacterial strain A7 at 20th days (Day-20) of inoculation (a-b) with the treatments as T₀ = Sterile distilled water as control, T₁ = Only bacterial cell suspension, T₂ = Only fungal spore suspension, T₃ = Bacterial cell suspension and fungal spore suspension, T₄ = Bacterial cell suspension two days before the fungal spore suspension and T₅ = Fungal spore suspension two days before the bacterial cell suspension at room temperature in three biological replicates.
