

A**B**

Figure S3: Comparison of the N-gene triplex RT-PCR to a commercial SARS-CoV-2 RT-PCR. Fourteen SARS-CoV-2 positive samples were tested in parallel by both assays and the threshold cycle (Ct) of the N-gene signals were compared (A). The Bland-Altman-Plot (B) shows the bias (mean difference between the Ct values of both methods, solid line) with the 95% limits of agreement (dashed lines).
