

# Revealing the Complexity of Sweepovirus-Deltasatellite-Plant Host Interactions: Expanded Natural and Experimental Helper Virus Range and Effect Dependence on Virus-Host Combination

Camila G. Ferro, F. Murilo Zerbini, Jesús Navas-Castillo and Elvira Fiallo-Olivé

## Supplementary Materials

**Figure S1:** Color-coded matrix of pairwise sequence identity scores generated by alignment of the full-length genomes of the sweepoviruses obtained in this work.

**Figure S2:** Recombination analysis using RDP4 package of the sweepovirus genomes obtained in this work.

**Figure S3:** Color-coded matrix of pairwise sequence identity scores generated by alignment of the full-length genomes of the deltasatellites obtained in this work.

**Figure S4:** DNA hybridization of petiole cross section blots of newly emerged young leaves of *Nicotiana benthamiana* plants agroinoculated with ToLCNDV, SiGYVV, ToLDeV or BCTV alone or in combination with SPLCD1.

**Figure S5:** DNA hybridization of petiole cross section blots of newly emerged young leaves of zucchini plants agroinoculated with ToLCNDV and SPLCD1.

**Table S1:** Information of the *Ipomoea indica* samples used in this study.

**Table S2:** Sweepovirus sequences retrieved from GenBank used for pairwise sequence identity, phylogenetic and recombination analyses.

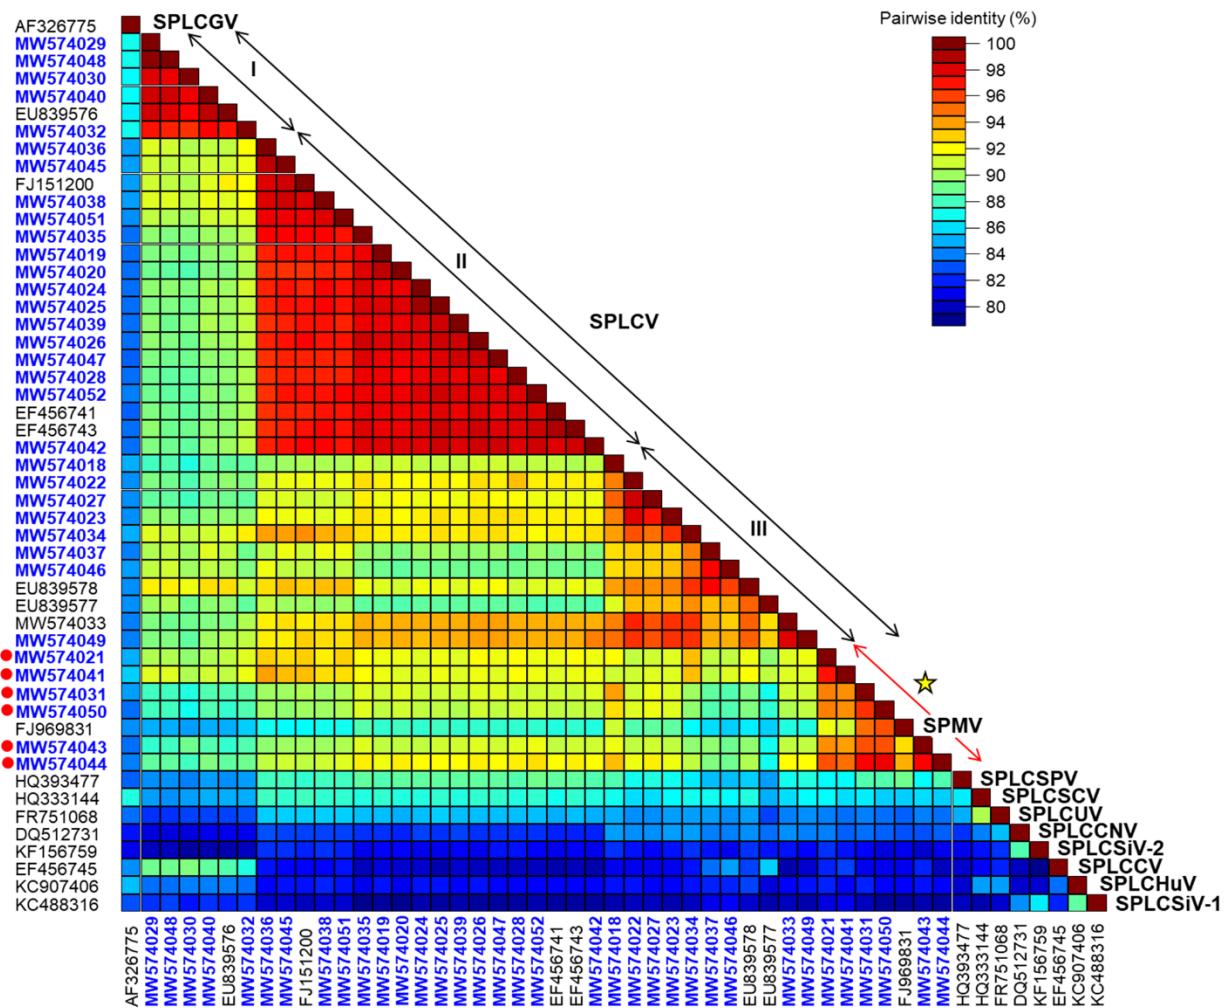

**Table S3:** Deltasatellite sequences retrieved from GenBank used for pairwise sequence identity, phylogenetic and recombination analyses.

**Table S4:** List of primers used for real-time PCR to amplify the deltasatellite and viral DNA or plant reference genes.

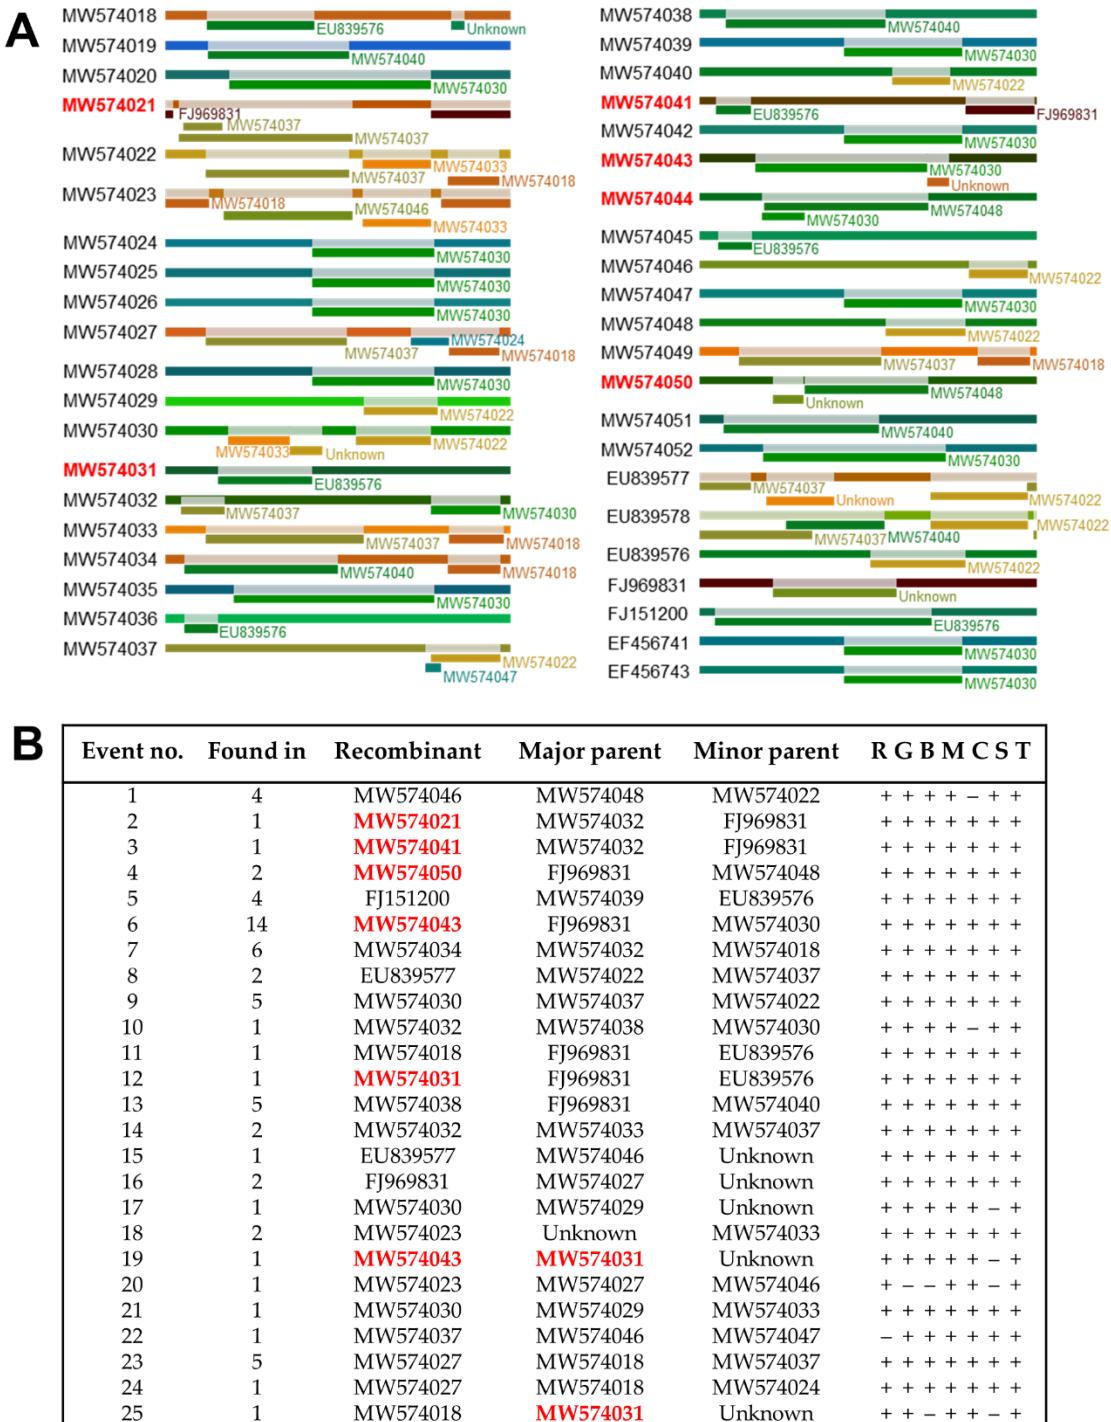

**Table S5:** Estimate of the coefficient of evolutionary differentiation for SPLCV and SPLCD1 genomes obtained in this work and isolates previously reported from Spain.

**Table S6:** Data of virus quantification by real-time PCR ( $2^{-\Delta\Delta Ct}$ ) used to generate Figure 7 with Graphpad Prism 6.0 software.

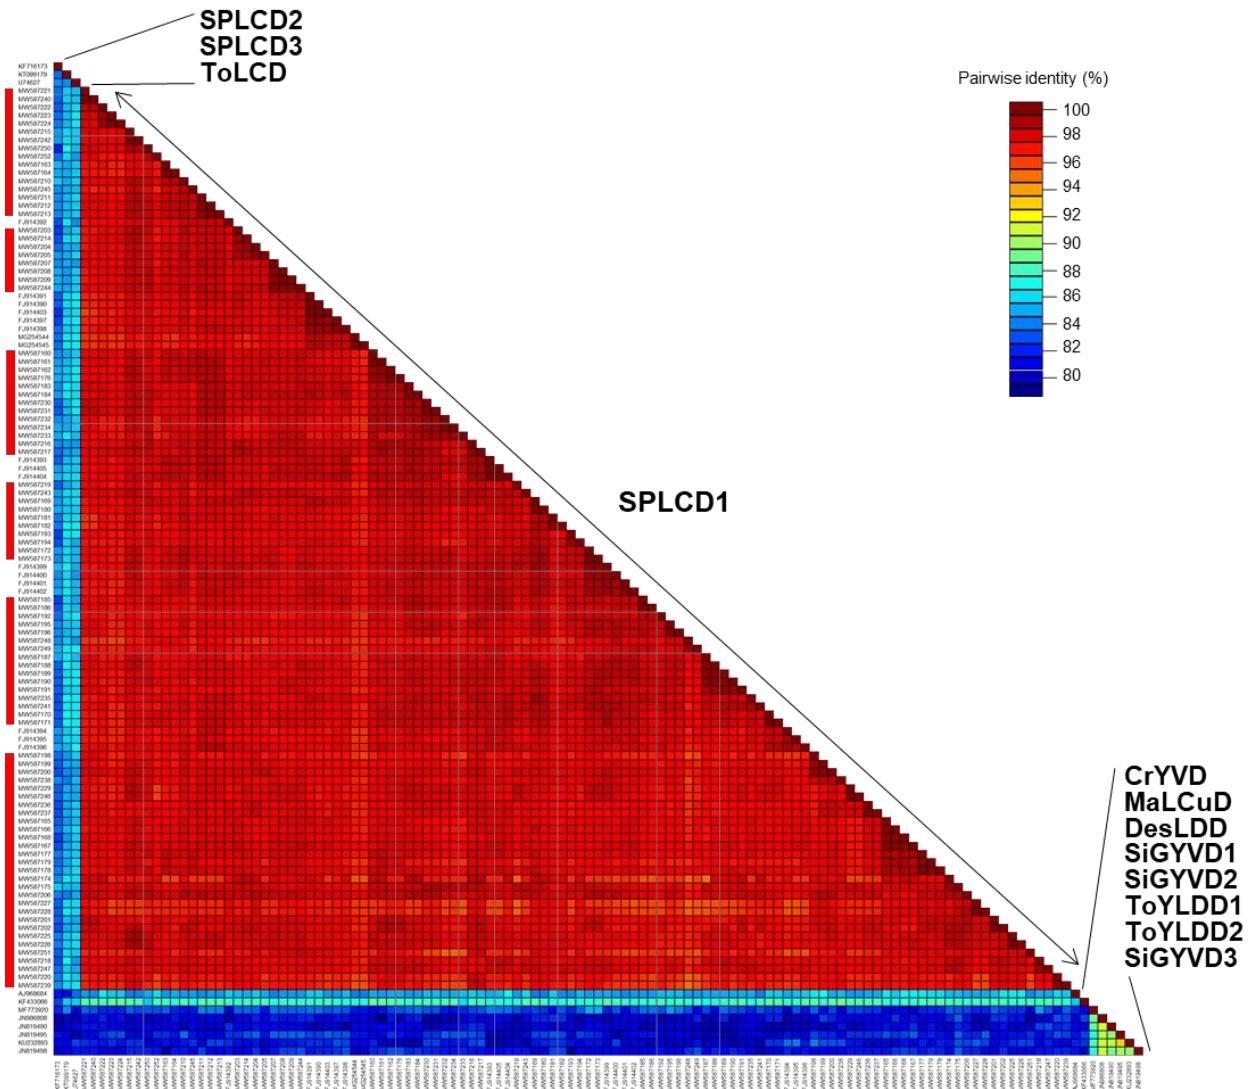

**Table S7:** Summary of statistical analyses performed to evaluate the effect of SPLCD1 on accumulation of helper geminivirids.

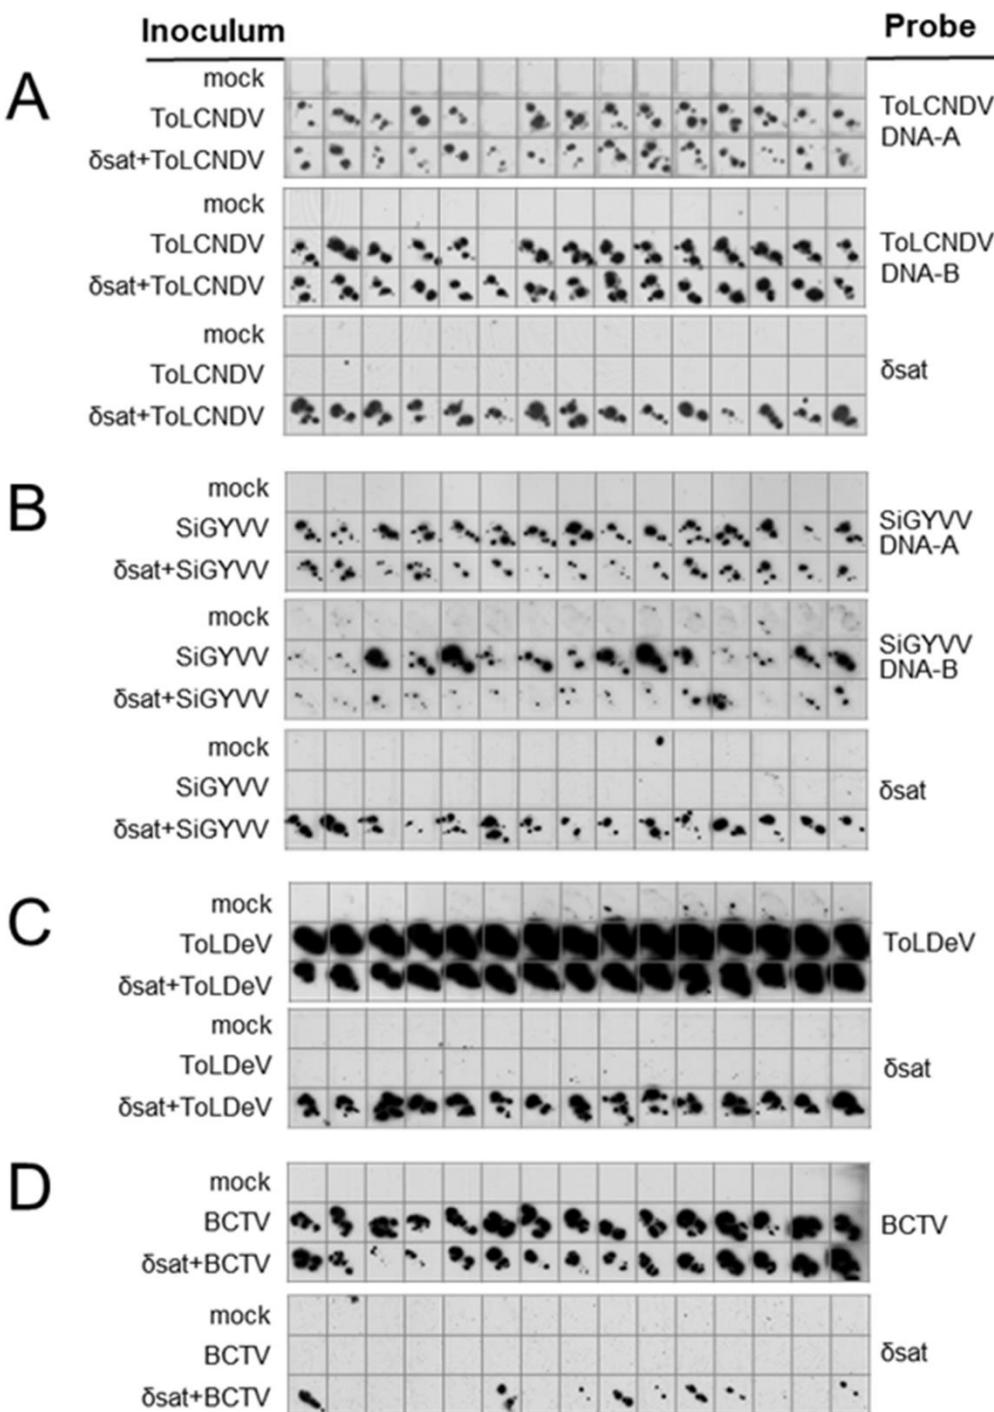

**Figure S1.** Color-coded matrix of pairwise sequence identity scores generated by alignment of the full-length genomes of the sweepoviruses obtained in this work (highlighted in blue), closely related sweet potato leaf curl virus (SPLCV) isolates previously reported from Spain and one representative isolate of all other sweepovirus species. I to III represent subgroups within the group of SPLCV isolates. The yellow star marks the group of sweepovirus sequences described in this work (red dots) showing  $\geq 91\%$  nucleotide identity with both sweet potato mosaic virus and SPLCV isolates. Additional details on the sequences and sweepovirus names are included in Tables S1 and S2.

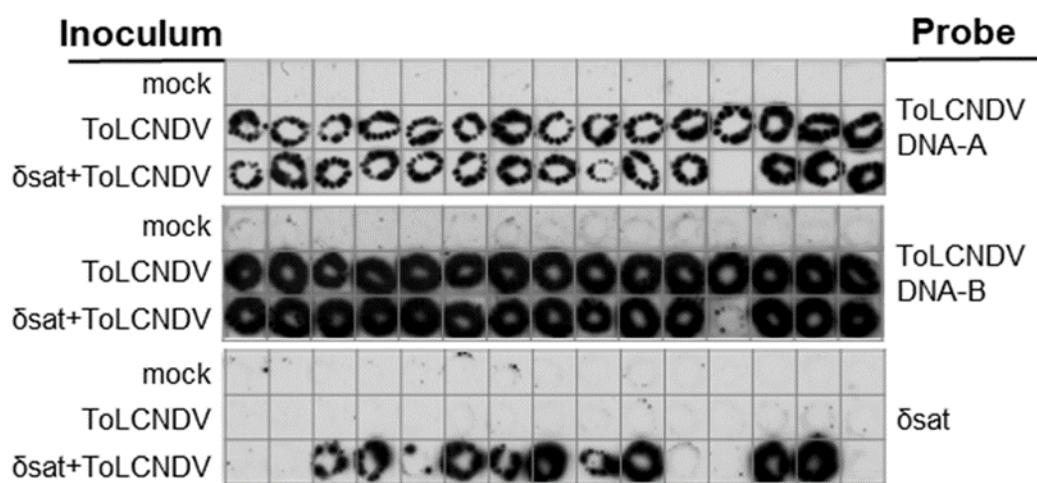

**Figure S2.** Recombination analysis using RDP4 package [32] of the sweepovirus genomes obtained in this work (MW574018-MW574052), closely related sweet potato leaf curl virus (SPLCV) isolates previously reported from Spain and a sweet potato mosaic virus (SPMV) isolate (FJ969831). **(A)** Schematic diagram showing putative recombinant fragments. **(B)** Overview of the recombination results showing for each recombination event the number of sequences where it was found, the putative recombinant sequence, the major and minor parents, and the methods (R, RDP; G, GENECONV; B, BOOTSCAN; M, MAXIMUM CHI SQUARE; C, CHIMAERA; S, SISTER SCAN and 3S, 3SEQ) that identified (+) it. Details on sweepovirus sequences retrieved from GenBank are given in Table S2. GenBank accessions numbers for sweepovirus isolates occupying an intermediate position between SPLCV and SPMV isolates are highlighted in red.

**Figure S3.** Color-coded matrix of pairwise sequence identity scores generated by alignment of the full-length genomes of the deltasatellites obtained in this work (marked with red lines at the left of the graph), sweet potato leaf curl deltasatellite 1 (SPLCD1) isolates previously reported from Spain and Portugal and one representative isolate of all other deltasatellite species. Additional details on the sequences and deltasatellite names are included in Tables S1 and S3.

**Figure S4.** DNA hybridization of petiole cross section blots of newly emerged young leaves of *Nicotiana benthamiana* plants agroinoculated with (A) tomato leaf curl New Delhi virus (ToLCNDV), (B) Sida golden yellow vein virus (SiGYVV), (C) tomato leaf deformation virus (ToLDeV) or (D) beet curly top virus (BCTV) alone or in combination with sweet potato leaf curl deltasatellite 1 (δsat). Probes used are indicated at the right of the figure. One of two experiments carried out with each geminivirid-deltasatellite combination (Table 2) is shown.

**Figure S5.** DNA hybridization of petiole cross section blots of newly emerged young leaves of zucchini plants agroinoculated with tomato leaf curl New Delhi virus (ToLCNDV) and sweet potato leaf curl deltasatellite 1 ( $\delta$ sat). Probes used are indicated at the right of the figure. Experiment 2 (Table 3) is shown.

**Table S1.** Information of the *Ipomoea indica* samples used in this study.
