Table S1. Summary of GAMM model selection statistic for evaluating the influence of weather conditions on the onset and end time of bat activity and relative abundance in a Mediterranean agricultural landscape in central Chile. The first model listed at each species is the minimum AIC model. Only models with a Δ_i of 2 or less are included as competing models. df: degrees of freedom; AIC: Akaike information criteria; Δ_i : differences in AIC with respect to the top-ranked model; W_i : Akaike weight Relative probability of each model being the best model). *TeSu* = Temperature before sunset; *HuSu* = Relative humidity before sunset; *TeNo* = Overnight temperature; *HuNo* = Overnight relative humidity; *Onset* = Onset time of activity of the species.
