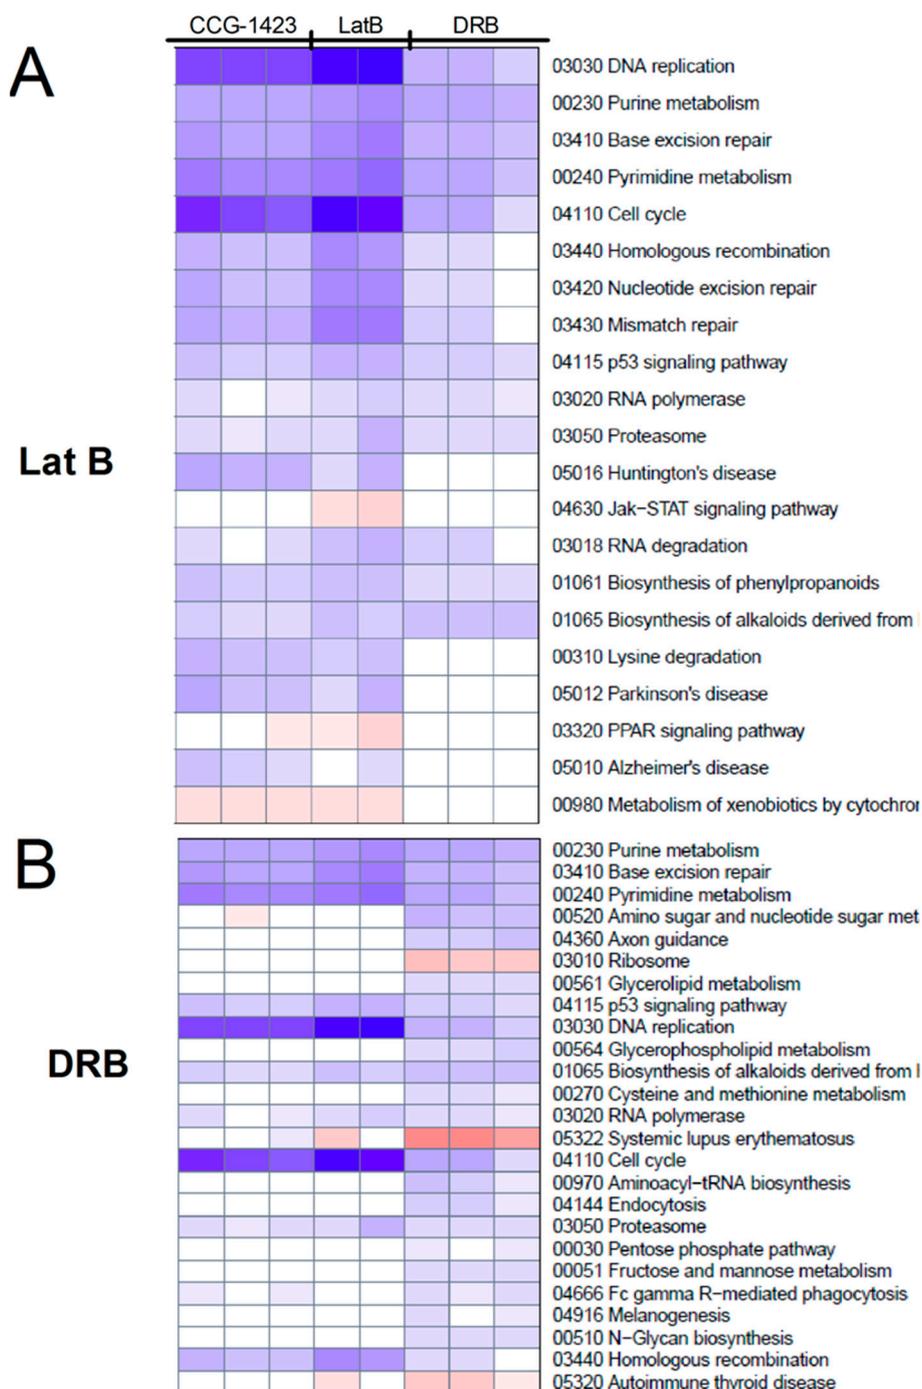

Figure S1. GSEA KEGG categories for gene families modulated by Lat B and DRB. The gene sets for different KEGG categories that were significantly associated with those altered by Lat B and DRB are illustrated as shown for CCG-1423 in Figure 4.

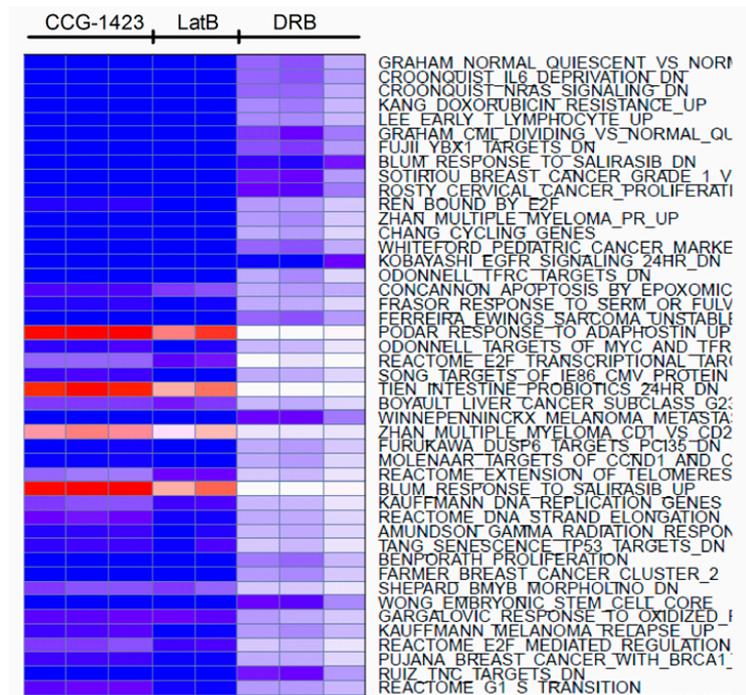

Figure S2. GSEA analysis for comparison to MSigDB experimental gene sets. Experimental gene sets of the MSigDB (Broad Version 3.0) were examined using GSEA and the entire microarray data set. The top 25 gene sets significantly associated with changes induced by CCG-1423 (3 μ M) are shown along with the related changes induced by Lat B (0.5 μ M) and DRB (30 μ M). See text and Table S4 for additional information. Colors represent Z-scores with Blue indicating genes of the set were downregulated and red indicating genes of the set were up-regulated. The darkness represents the level of significance. White means that the adjusted p value is >0.05 .

Table S1. CCG-1423 and Lat B regulated genes (2 h). Blue highlighted gene transcripts indicate genes stimulated by CCG-1423, and red highlighted gene transcripts indicate genes inhibited by CCG-1423.

Table S2. Metastasis-Related “Candidate” Gene Transcripts. The 2142 genes changed by CCG-1423 were filtered using metastasis-related gene ontology (GO) categories, including: angiogenesis, cell migration, cell adhesion, epithelial-mesenchymal-transition, extracellular matrix, G-protein coupled receptor protein signaling pathway, inflammatory response, and metalloendopeptidases. This table lists the 203 unique metastasis-related genes identified using this criterion. For several genes, there are multiple probesets. Blue highlighted gene transcripts indicate genes stimulated by CCG-1423, and red highlighted gene transcripts indicate genes inhibited by CCG-1423.
