Preliminary statistical treatment

Table S1. D'Agostino-Pearson normality test.

Statistics ^a	Male	Female
n	261	152
g1	-0.209	0.073
g2	0.114	-0.100
Z₁(g1)	-0.846	0.290
Z₂(g2)	0.505	0.418
K²	0.971	0.259
Degree of freedom	2	2
p-value	0.615	0.878

^a *n* is the number of observations, *g1* is the sample skewness, *g2* is the sample kurtosis, *Z₁*(*g1*) is the standard normal deviate of sample skewness, *Z₂*(*g2*) is the standard normal deviate of sample kurtosis and $K^2 = (Z_1(g1))^2 + (Z_2(g2))^2$ is the statistic criterion and if the null hypothesis of normality is true, then K^2 is approximately χ^2 -distributed with 2 degrees of freedom.

Being both *p*-value > 0.05, it was possible to confirm the Gaussian distribution of the two subgroups.

Figure S1. Box-and-whisker plot of male subgroup for the inspection of the outliers (plotted with an asterisk).

Figure S2. Box-and-whisker plot of female subgroup for the inspection of the outliers (plotted with an asterisk).

Table S2. Descriptive statistic (TAC values, μmol L⁻¹) for healthy and pathological subgroups.

Subgroup	n	Median	Mean	St. dev.	Min	Max	25 percentiles	75 percentiles	Age ^a
Descriptive statistic on original dataset of healthy donors (n = 413)									
Male	261	1008	1015	143	568	1415	929	1115	19 – 65
Female	152	856	864	115	571	1181	787	944	19 – 62
Descriptive statistic on dataset of healthy donors with outlier removal (n = 409)									
Male	258	1008	1016	137	679	1379	930	1115	19 – 65
Female	151	856	862	113	571	1136	786	944	19 – 62
Descriptive statistic on for hyperuricemic patients									
Male	54	1275	1288	91	1057	1555	1239	1333	-
Descriptive statistic on for hyperbilirubinemic patients									
Male	25	1260	1389	452	857	2408	1121	1443	-
Descriptive statistic on for dialysis patients									
Pre-dialysis	50	1485	1520	344	727	2722	1382	1610	-
Post-dialysis	50	728	737	109	527	1047	659	818	-
Descriptive statistic on for diabetic patients									
Male	55	1020	1033	138	748	1296	927	1137	-
Female	38	957	973	113	750	1171	915	1054	-

^a age expressed in years.

Table S3. Assessment of the age effect on the TAC values. Statistical parameters of male and female subgroups data subdivided into four age-intervals and the corresponding one-way ANOVA reports.

Males					
Age interval ^a	18 – 30	31 – 40	41 – 50	51 – 65	
n ^b	46	98	72	42	
Mean	998	1030	998	1037	
Median	984	1048	991	1015	
Standard deviation	139	134	136	142	
Min	684	690	679	780	
Max	1379	1328	1255	1370	
ANOVA report ($\alpha=0.05$)					
	Sum of squares	Degrees of freedom	Variance	F	p-value
Age intervals	76.1·10 ³	3	25.4·10 ³	1.3643	0.2530
Prediction error	47.3·10 ⁵	254	18.6·10 ³		
Females					
Age interval ^a	18 – 30	31 – 40	41 – 50	51 – 65	
n ^b	45	44	45	17	
Mean	847	875	844	871	
Median	829	885	861	875	
Standard deviation	115	113	112	114	
Min	637	600	571	683	
Max	1113	1136	1044	1134	
ANOVA report ($\alpha=0.05$)					
	Sum of squares	Degrees of freedom	Variance	F	p-value
Age intervals	19.2·10 ³	3	64.1·10 ²	0.4968	0.6894
Prediction error	19.0·10 ⁵	147	12.9·10 ³		

^a age interval expressed in years.^b *n* is the number of observations; mean, median, standard deviation, min and max are expressed in μmol L⁻¹.
