FG%: final germination percentage; GR: germination rate; VI (I): vigor index I, and VI (II): vigor index II. Data presented are mean (±SE) of three replicates. The difference in letters indicates significant differences at ($P < 0.05$) using Duncan's multiple range tests.

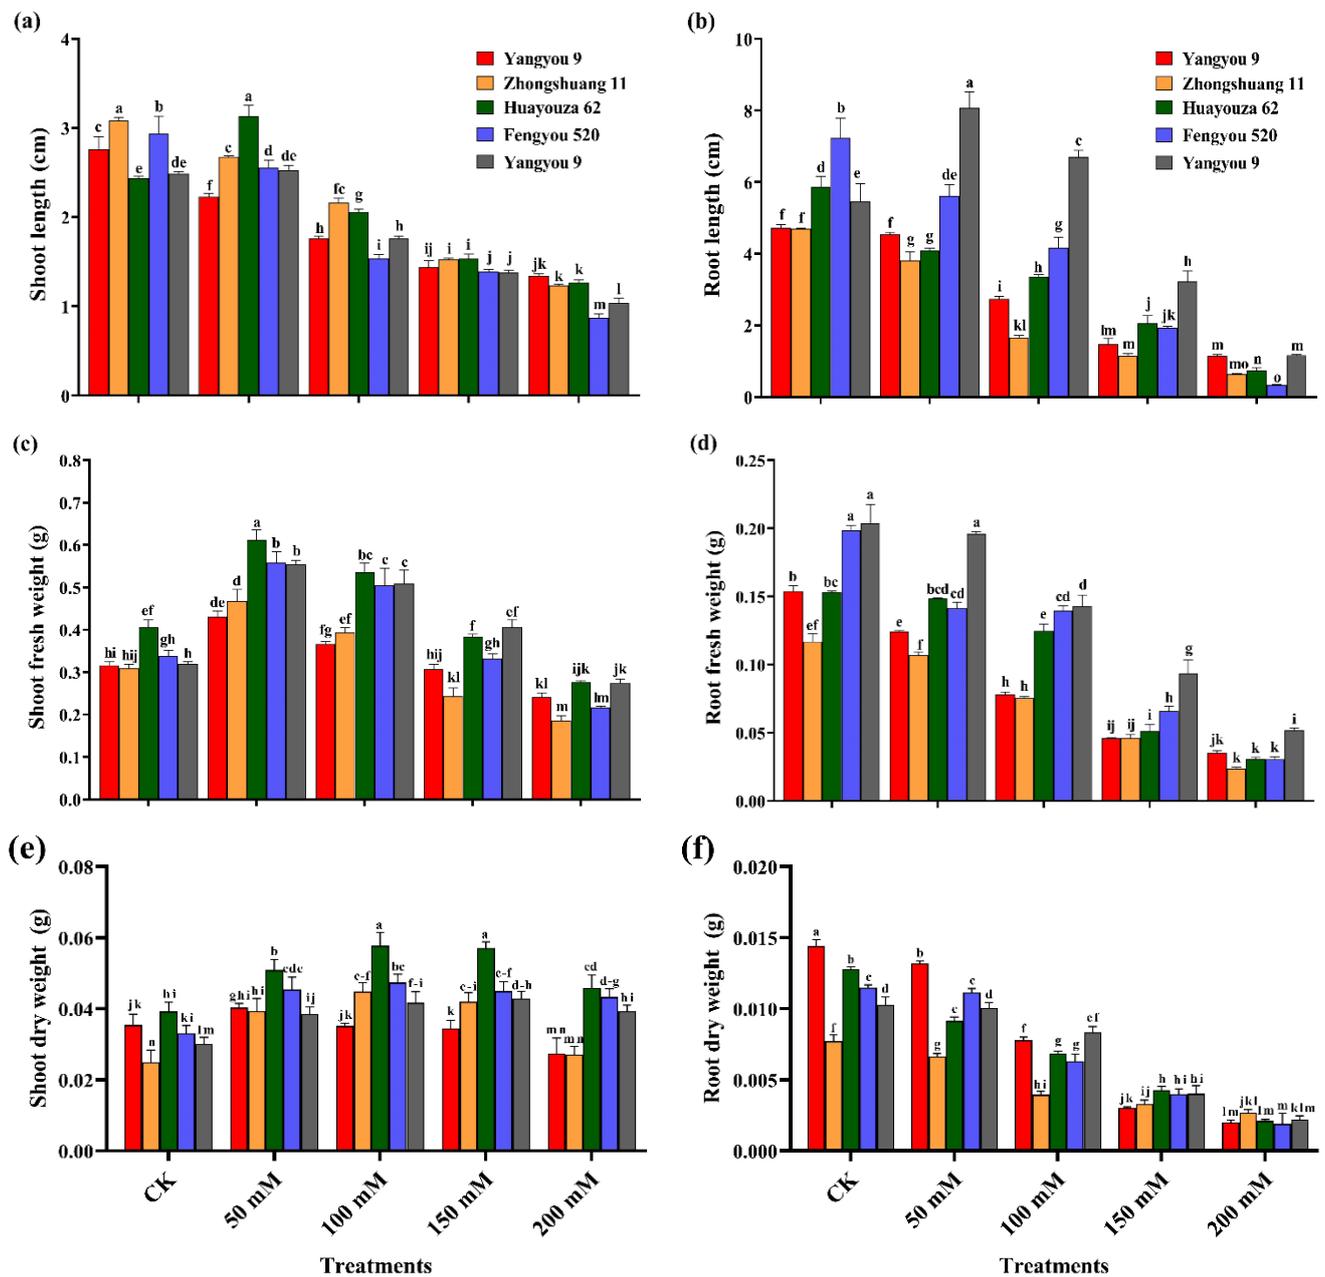

Figure S1. The impact of NaCl treatments on (a) shoot length (cm); (b) root length (cm); (c) shoot fresh weight (g); (d) root fresh weight (g); (e) shoot dry weight (g), and (f) root dry weight (g) of five rapeseed cultivars during the early seedling stage. Bars represent \pm SE of three replicates. The difference in letters indicates significant differences at ($P < 0.05$) using Duncan's multiple range tests.

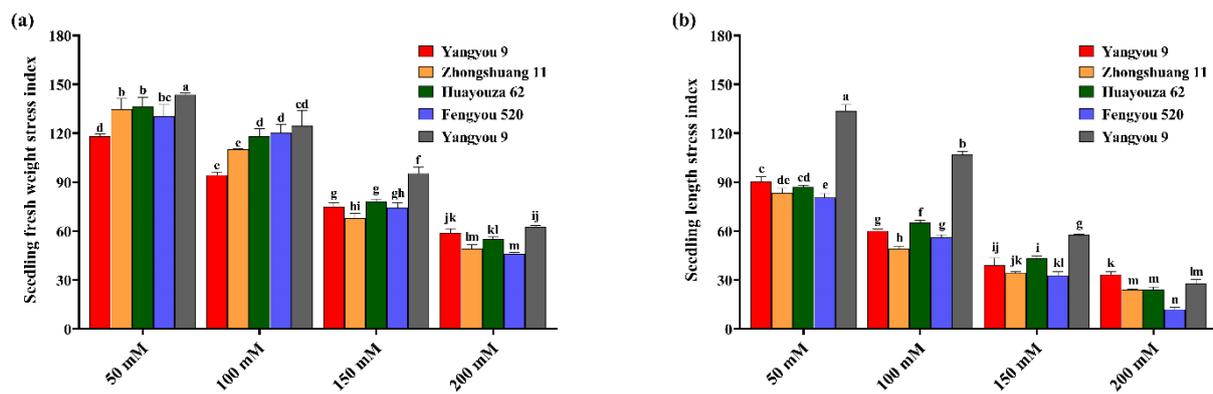

Figure S2. The impact of NaCl treatments on (a) seedling fresh weight stress index and (b) seedling length stress index of five rapeseed cultivars during the germination stage. Bars represent \pm SE of three replicates. The difference in letters indicates significant differences at ($P < 0.05$) using Duncan's multiple range tests.

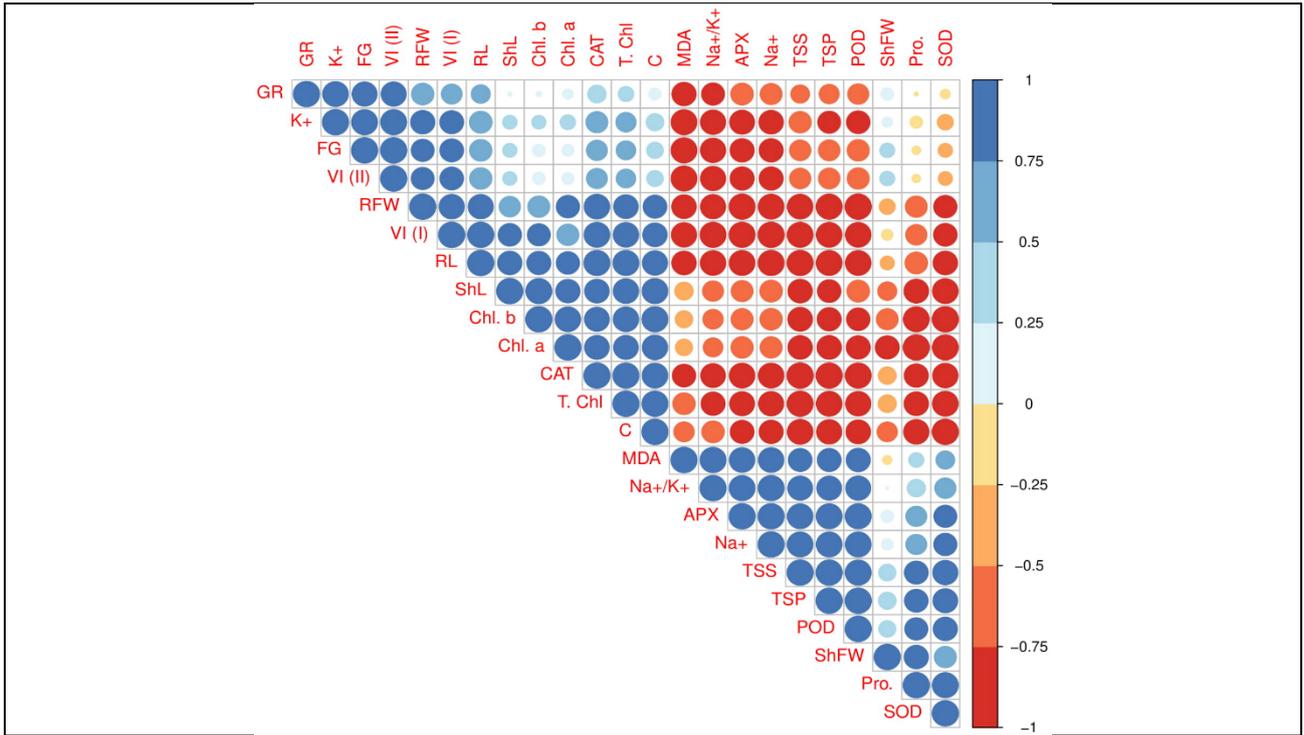

Figure S3. Correlation among different growth and biochemical attributes of rapeseed cultivars. FG: final germination %; GR: germination rate; VI (I): vigor index I; VI (II): vigor index II; SL: shoot length; RL: root length; ShFW: shoot fresh weight; RFW: fresh root weight; Chl. a: chlorophyll a; Chl. b: chlorophyll b; T. Chl: total chlorophyll; C: carotenoid content; TSS: total soluble sugar; TSP: total soluble protein; pro.: proline %; MDA: malondialdehyde content; Na⁺: sodium ions; K⁺: potassium ions; SOD: superoxidase activity; POD: peroxidase activity; APX: ascorbate peroxidase activity, and CAT: catalase activity.

Table S2. Metabolites differentially accumulated in Yangyou 9 and Zhongshuang 11 seeds upon salt stress (150 mM NaCl).
