Supplementary Figure S1. Representation of the areas used to quantify the row of nuclei and (immune)fluorescence. Sections I a and b correspond to nerve area; Sections II a and b correspond to mid periphery retina and sections III a and b correspond to far periphery retina. The total measurement of each area is approximately 800 μm .

Supplementary Figure S2. Representation of a negative control staining with the secondary antibody Alexa Fluor® 488 goat An-ti-rabbit IgG. Image correspond to a PN17 rds retina.
