<sup>1</sup> Values are the means of three replicates for the peak area relative to the internal standard ± standard deviation (SD). \*, P<0.05; <sup>2</sup> High-fat diet 45%; <sup>4</sup> High-fat diet 45% + cyanidin 3-O-β-D-glucoside.

**Figure S1.** C3G modulates ROS and cell signalling in hepatocarcinoma cells. A) Effect of C3G on the viability of HepG2 cells co-treated with 50 and 200 μM H<sub>2</sub>O<sub>2</sub> for 24h. The results represent the mean ± SEM (n=3). For comparisons between two groups, Student's t-test was performed. \*, P < 0.05; \*\*, P < 0.01; \*\*\*, P < 0.005 compared with controls. C, control (0.1% DMSO); C3G, Cyanidin 3-glucoside; ns, not statistically significant.

**Figure S2.** Several potential molecular pathways are involved in cellular senescence and C3G presumably regulates cell fate in an AMPK/p53-dependent manner.
