*Values in the same column marked with an asterisk in superscript are statistically significant ($p < 0.05$).

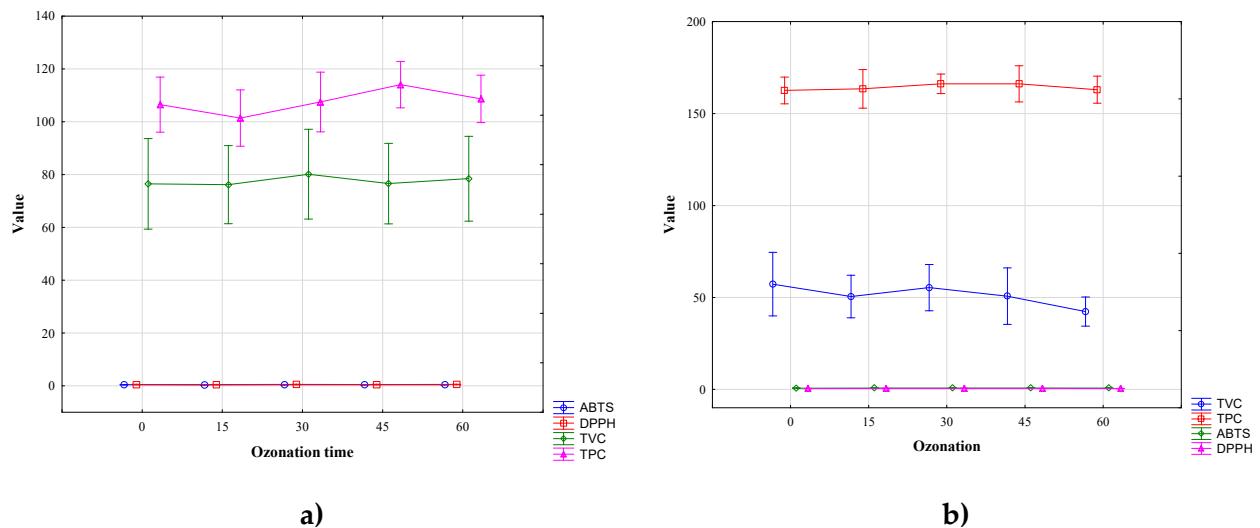

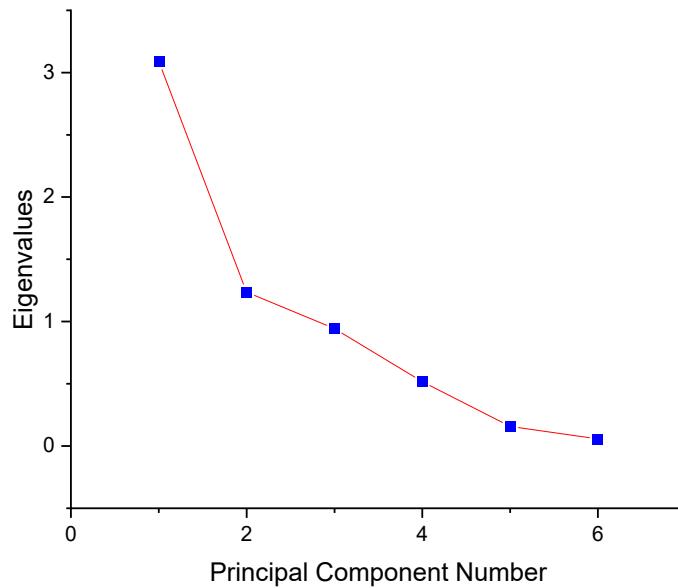

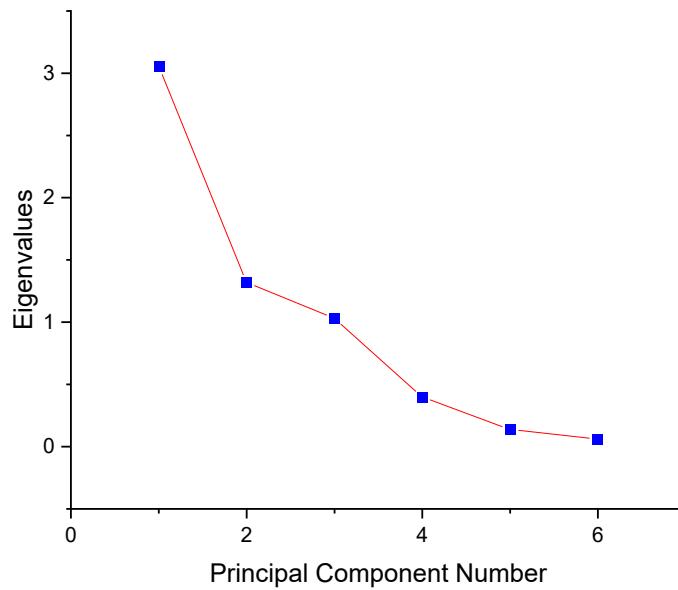

Figure S1. Means plot and 95% confidence interval: for raspberries (panel a) and strawberries (panel b). Results of one-way analysis of variance (one-way ANOVA) taking into account the ozonation effect.

PCA– antioxidant properties, bioactive compound

a)

b)

Figure S2. Scree plot obtained from Principal Component Analysis (PCA) of the phenolic contents (TVC, TPC), antioxidant capacities (DPPH and ABTS), ozonation time and storage condition of raspberry (panel a) and strawberry (panel b).

FTIR spectroscopy

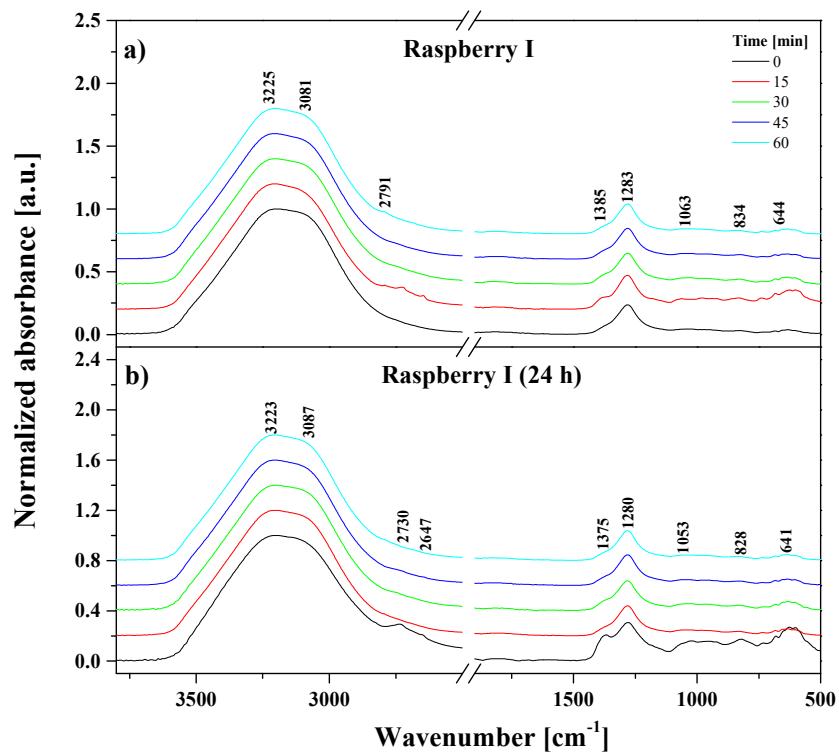

Figure S3. FTIR absorption spectra for the analyzed *Enrosadira* raspberry variety. One part of raspberry fruit was frozen immediately after ozonation (panel a). The second part of the raspberry fruit was stored for 24 h under refrigeration conditions and then also frozen (panel b).

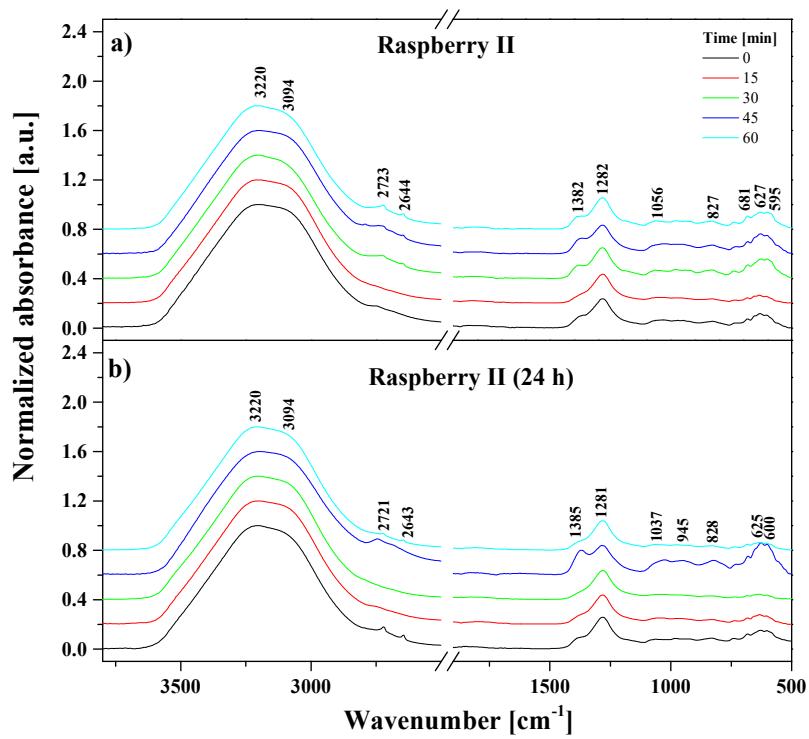

Figure S4. FTIR absorption spectra for the analyzed *Kwazi* raspberry variety. One part of raspberry fruit was frozen immediately after ozonation (panel a). The second part of the raspberry fruit was stored for 24 h under refrigeration conditions and then also frozen (panel b).

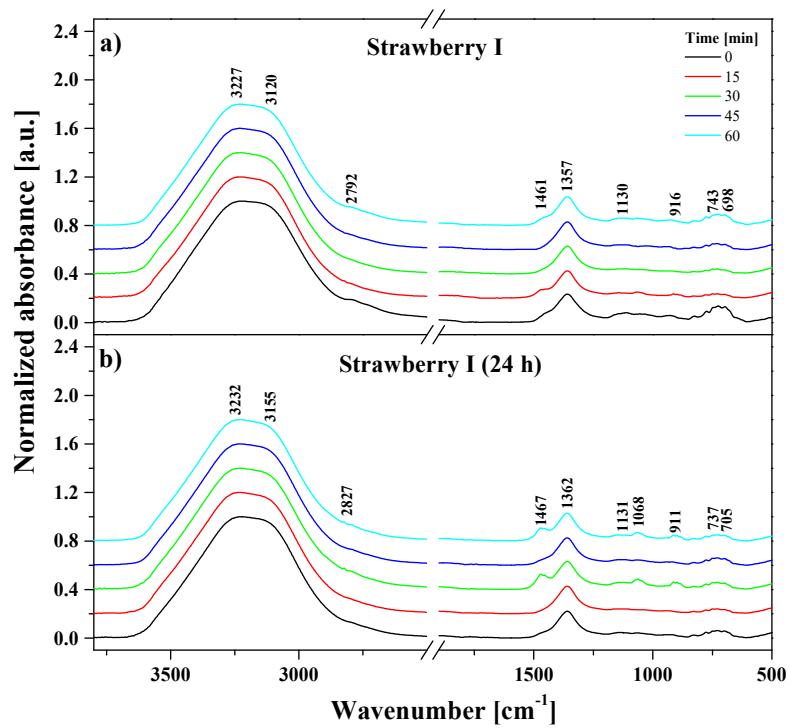

Figure S5. FTIR absorption spectra for the analyzed *Portola* strawberry variety. One part of raspberry fruit was frozen immediately after ozonation (panel a). The second part of the raspberry fruit was stored for 24 h under refrigeration conditions and then also frozen (panel b).

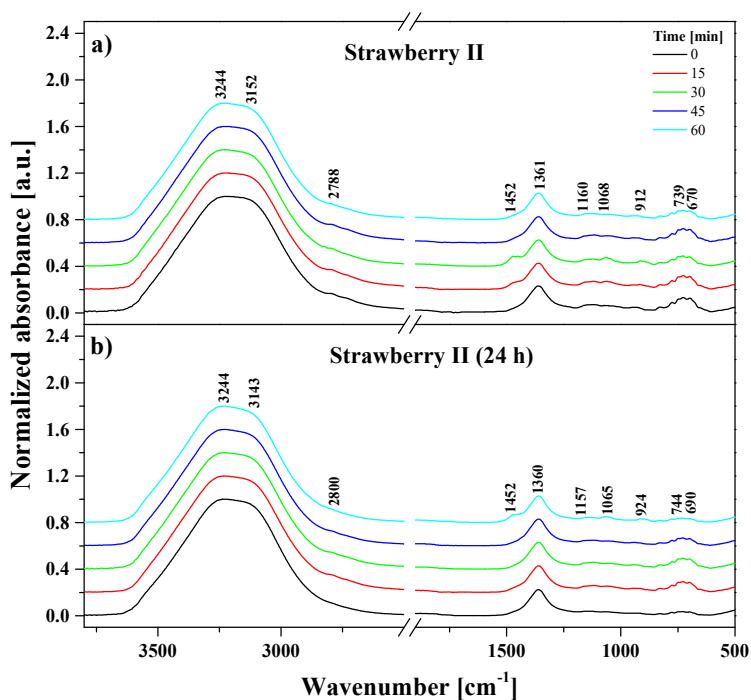

Figure S6. FTIR absorption spectra for the analyzed *Enduro* strawberry variety. One part of raspberry fruit was frozen immediately after ozonation (panel a). The second part of the raspberry fruit was stored for 24 h under refrigeration conditions and then also frozen (panel b).

PCA–FTIR spectra

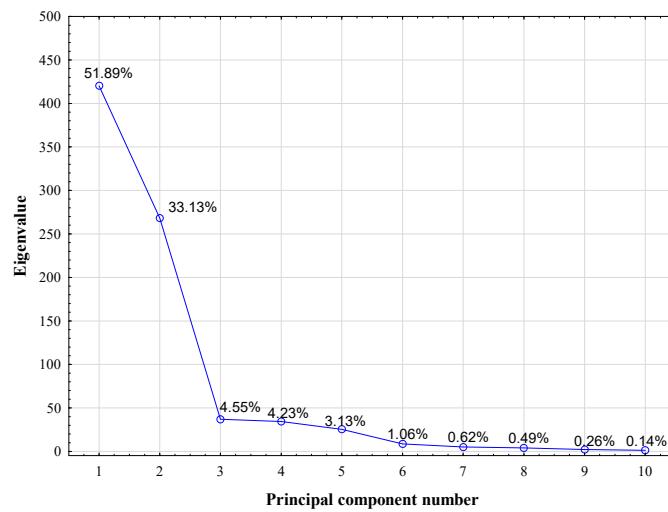

Figure S7. Scree plots (eigenvalues from principal components) for all examined samples of raspberry and strawberry from FTIR spectra (1800–500 cm⁻¹ region).

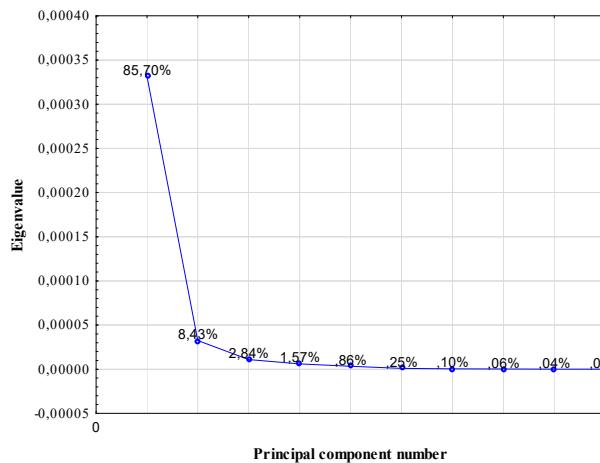

Figure S8. Scree plots (eigenvalues from principal components) for all examined samples of raspberry and strawberry from FTIR spectra (1800–500 cm⁻¹ region). The pre-processed (smoothing with 20 windows + 1st derivation) FTIR spectra.
