Results were based on the mean of a triplicate measurement ± SD (n=3).

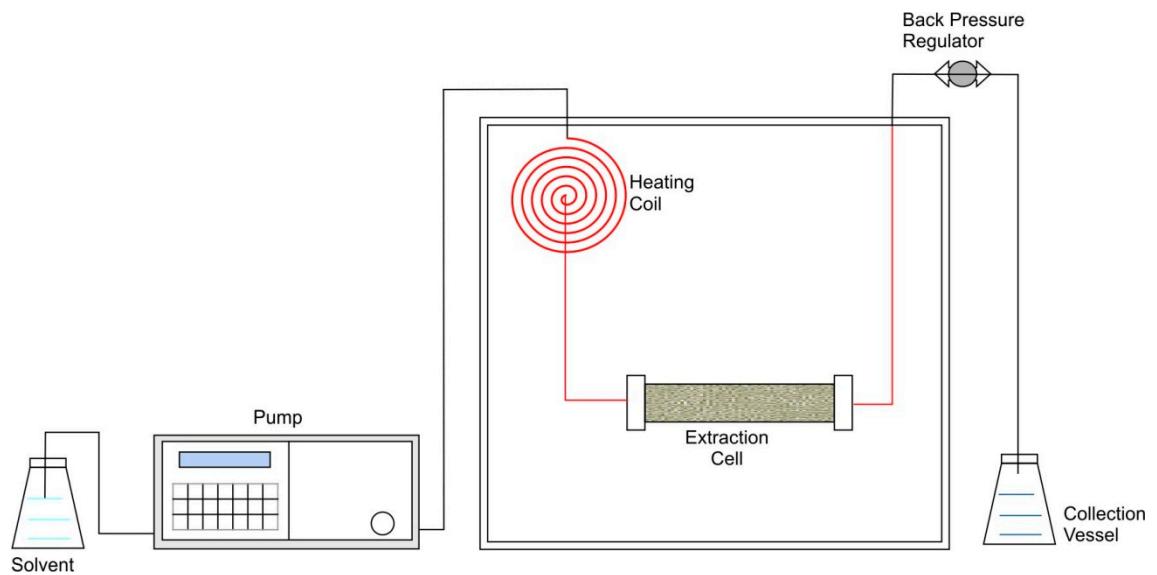

Figure S1. Instrumental setup for pressurized hot water extraction (PHWE) system.

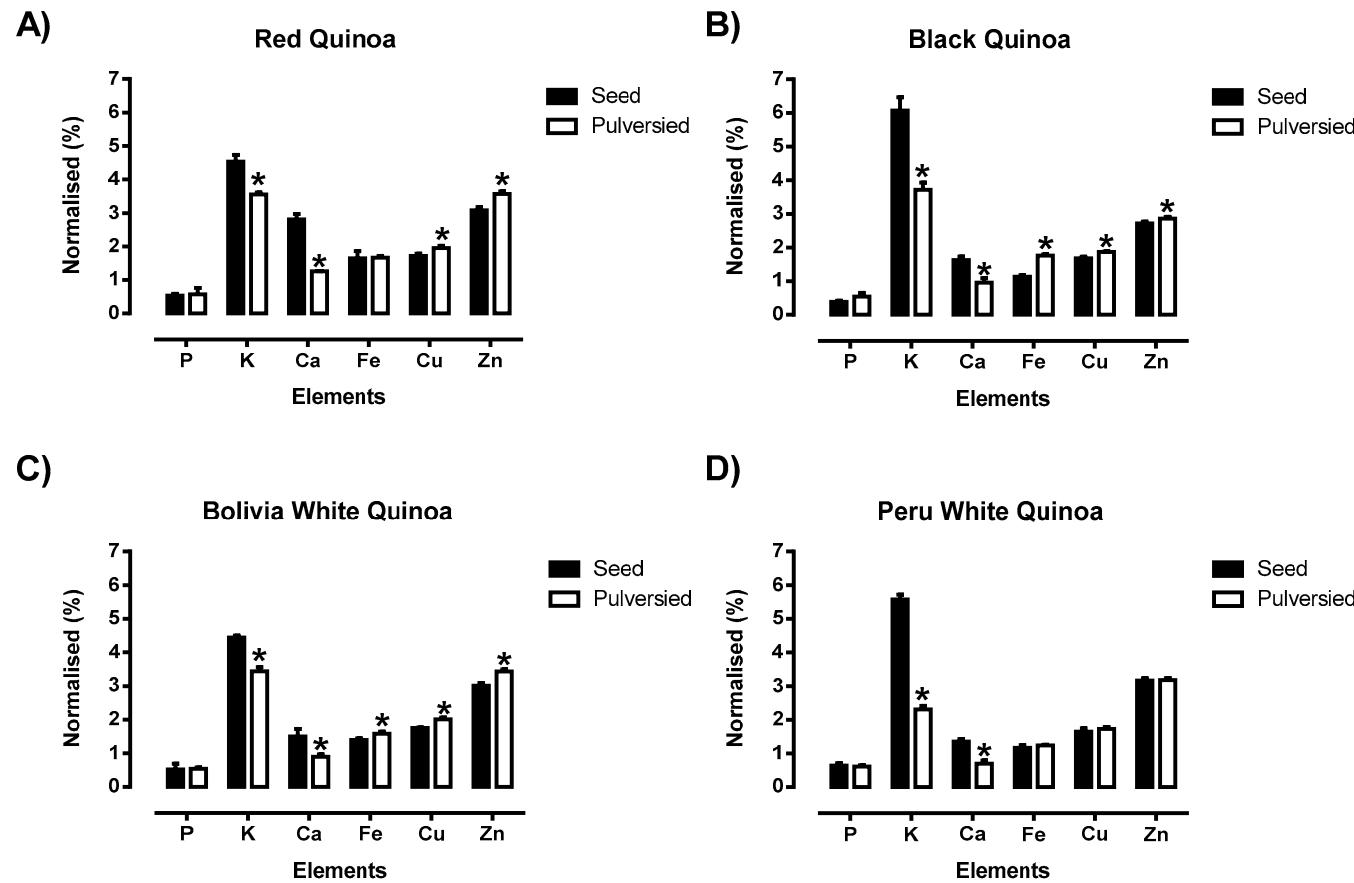

Figure S2: Normalized peak intensity by XRF from red (A), black (B), Bolivia white (C) and Peru white (D) quinoa. \* Significant difference ( $p \leq 0.05$ ) between whole seed and pulverized seeds from black, red and white quinoa. Pulverization of the quinoa significantly decreased K and Ca when compared to whole seed. However, in most cases with the exception of white quinoa (Peru), other elements such as Fe, Cu and Zn were significantly increased in the pulverized seeds when compared to whole seeds. Data are expressed as mean  $\pm$  SD ( $n=3$ ).

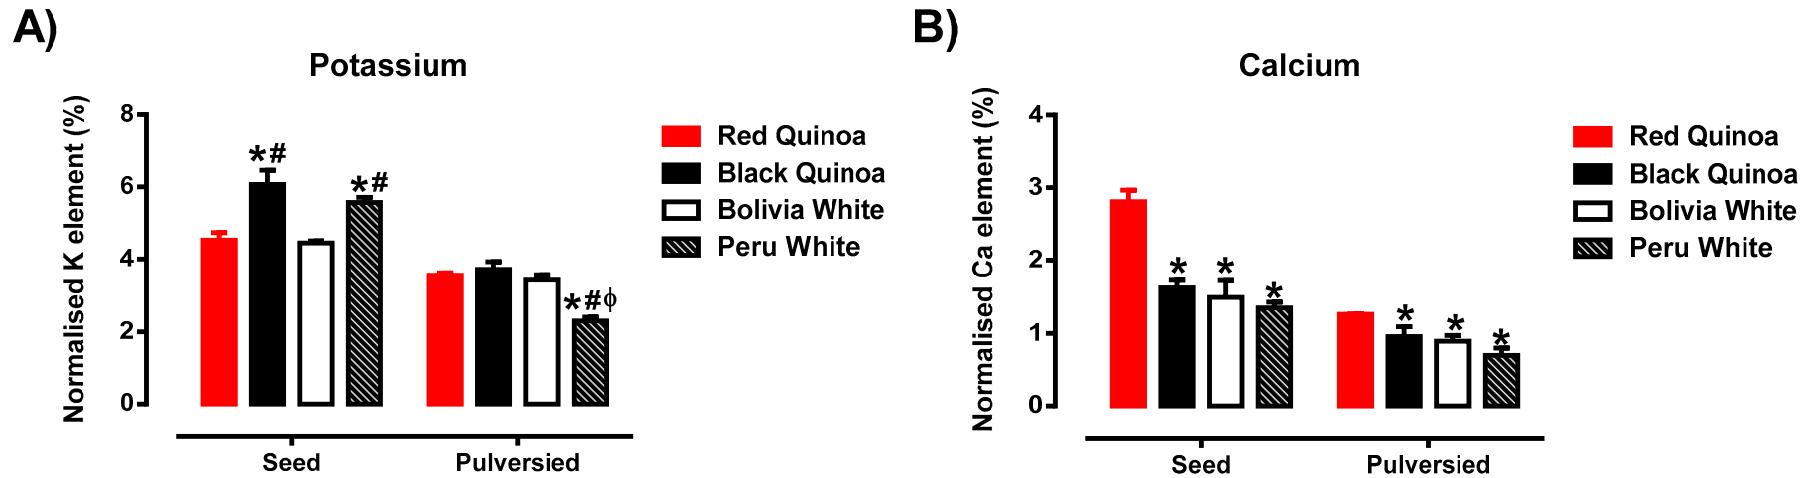

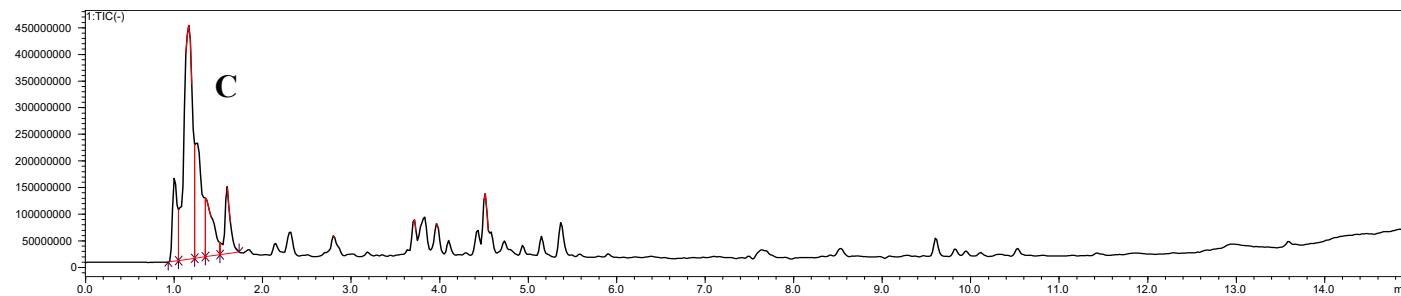

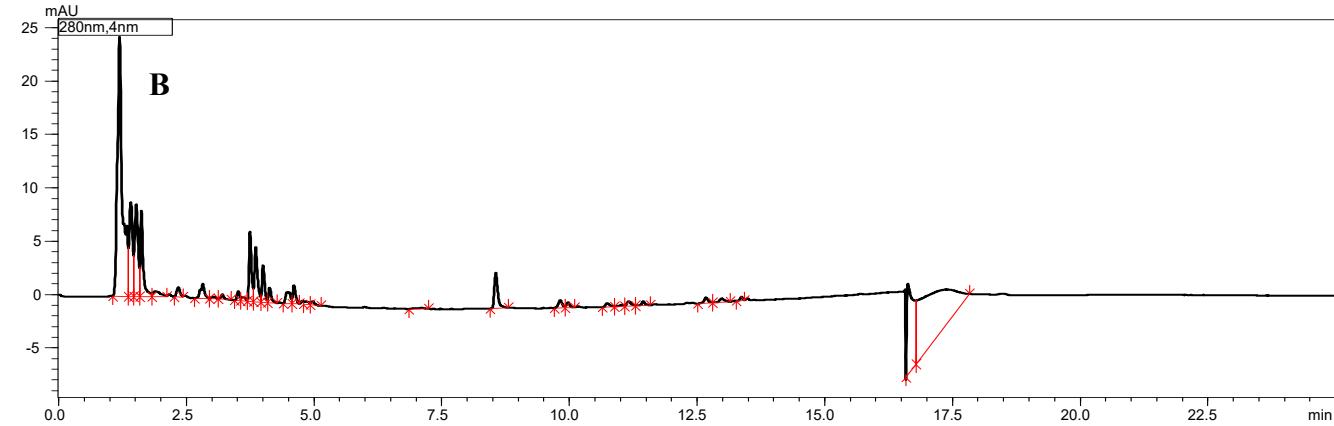

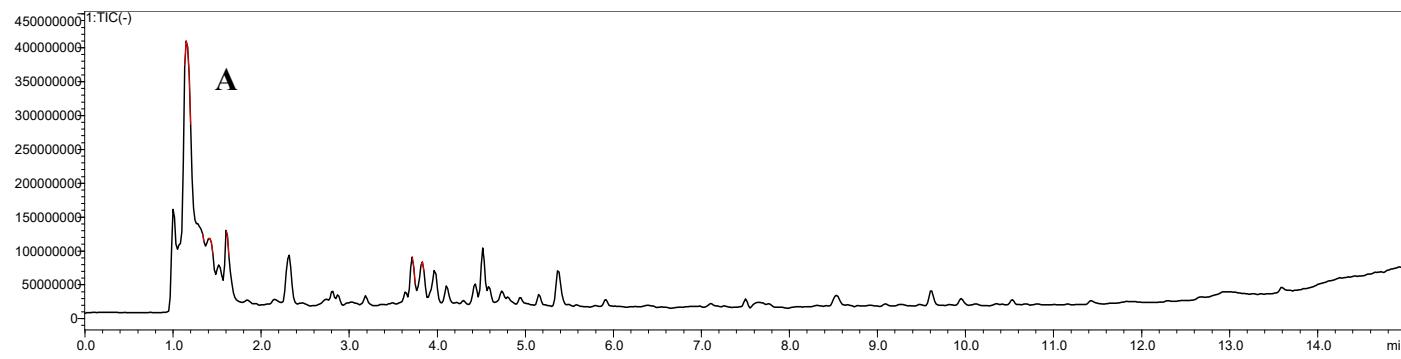

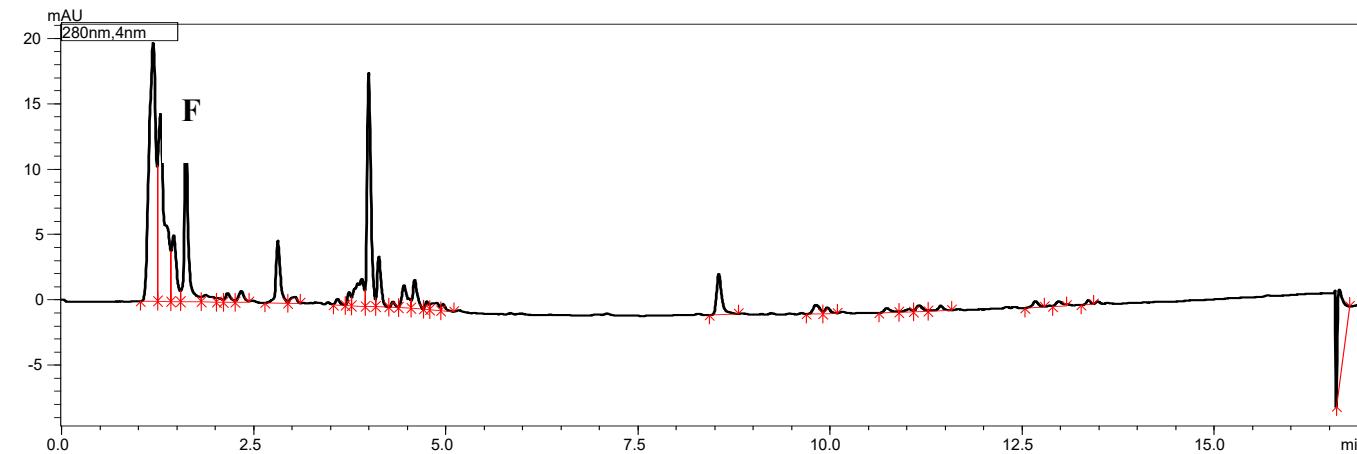

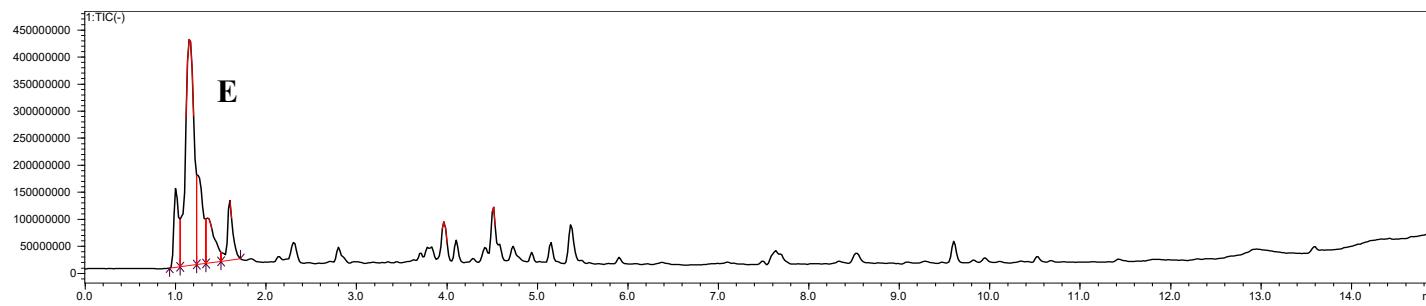

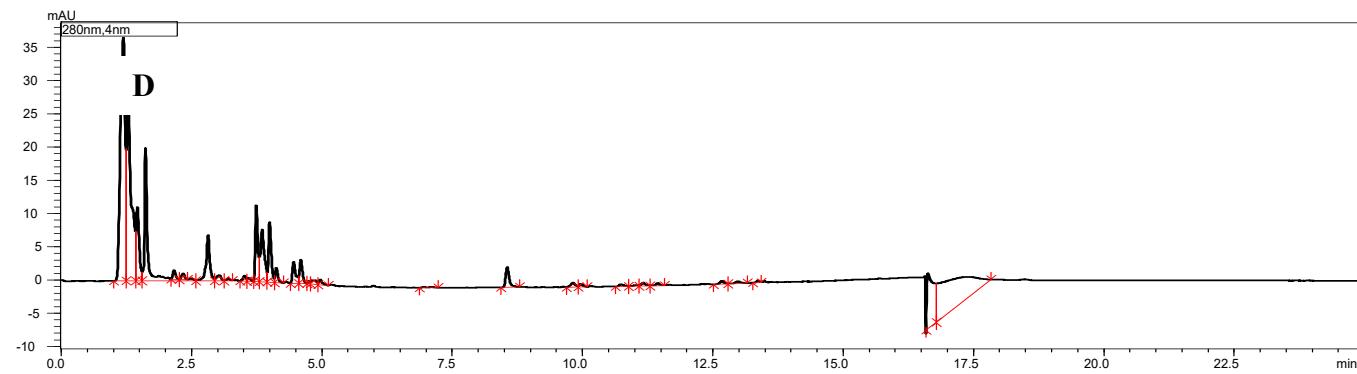

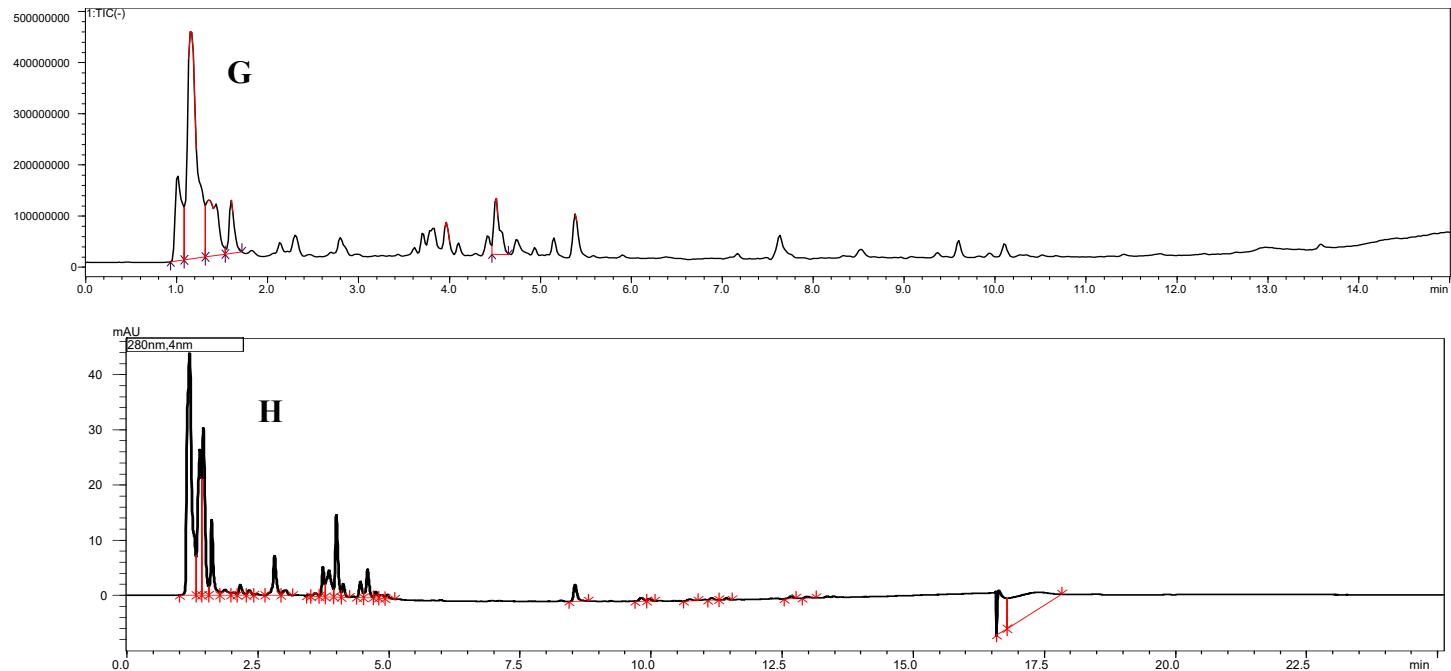

Figure S3: Comparison of normalized peak intensity of potassium (A) and Calcium (B) between red, black, Bolivia white and Peru white quinoa. \* Significant difference ( $p \leq 0.05$ ) between red quinoa within whole seed and pulverized seeds. # Significant difference ( $p \leq 0.05$ ) between Bolivia white quinoa within whole seed and pulverized seeds.  $\Phi$  Significant difference ( $p \leq 0.05$ ) between black quinoa within whole seed and pulverized seeds. Data are expressed as mean  $\pm$  SD ( $n=3$ ).

**Figure S4.** LC-UV-MS chromatograms of black, red and white quinoas. A and B: Black quinoa, C and D: Red quinoa, E and F G: White Peruvian quinoa, G and H: White Bolivian quinoa. 1: LC-MS, 2: LC-UV detected at 280nm.
