

Table S1. Correlation matrices calculated for embryonic axes (A) and cotyledons (B) of Norway maple (*Acer platanoides*), and embryonic axes (C) and cotyledons (D) of sycamore (*Acer pseudoplatanus*) based on levels of hydrogen peroxide (H₂O₂), superoxide anion radical (O₂^{•-}), hydroxyl radical (•OH), ascorbic acid (AsA), dehydroascorbic acid (DHA), total pool of ascorbate (Asc), Asa to DHA ratio (AsA/DHA), levels of reduced glutathione (GSH), oxidized glutathione (GSSG), degree of oxidation of glutathione (DO), water content (WC), levels of protein-bound methionine sulfoxide (MetO), and the abundance of methionine sulfoxide reductase isoforms (MsrB1, MsrB2) against data published in Alipour et al. (2020) referring to levels of reduced (NADH) nicotinamide adenine dinucleotide (NAD), NADH to NAD⁺ ratio (NADH/NAD⁺ ratio), levels of reduced (NADPH) nicotinamide adenine dinucleotide phosphate (NADP), NADPH to NADP⁺ ratio (NADPH/NADP⁺ ratio) and reducing power based on NAD(P) concentrations. The intensity of color refers to the strength of correlation (R) coefficient (blue, positive; red negative). The intensity of red to orange color refers to the *P* value.

A) Norway maple embryonic axes
