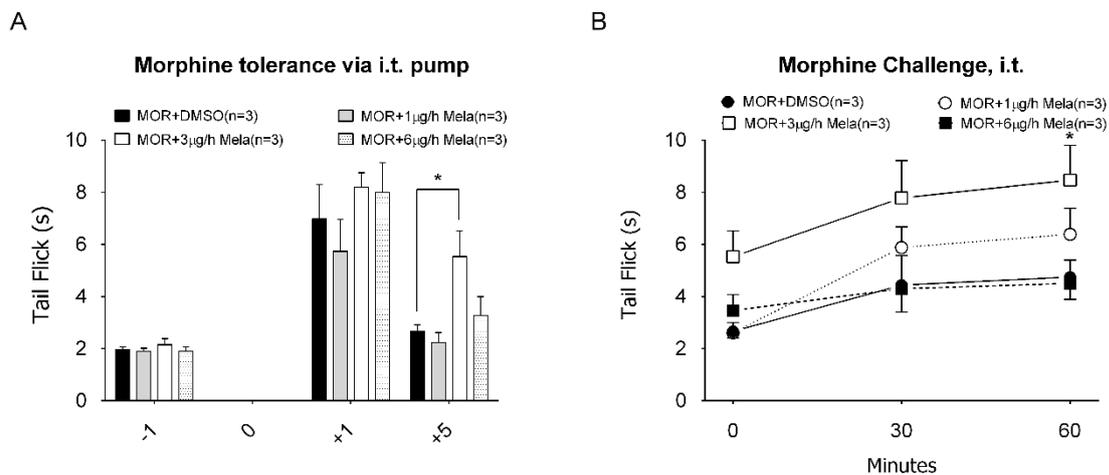

Figure S1. Dose-dependent effect of i.t. melatonin on the Wistar rat morphine tolerance development. (A) Continuous administration of Mela (1, 3, or 6 µg/h) or solvent-DMSO in morphine (MOR)-induced tolerant rats via i.t. pump infusion. Tail-flick test was performed before and 1 and 5 days after pump implantation (day 0) for morphine tolerance measurement. (B) After i.t. pump infusion for five days, rats were further challenged with 15 µg of morphine (i.t.). Tail-flick test was performed for 120 min to validate the tolerance. * denotes statistically significant differences between MOR + Mela and MOR + DMSO. * $p < 0.05$.

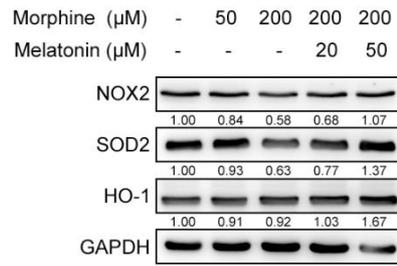

Figure S2. Mouse microglia ECO 13.31 cells were incubated with morphine (50–200 μM) alone or cotreated with 20–50 μM of melatonin for 72 h. Total protein lysates were collected, and the relative protein expression level of NOX2, SOD2, and HO-1 were determined by immunoblotting with respective antibodies.

Table S1. Full gene expression array of rats treated with an i.t. pump of MOR (15 µg/h) alone or combined with 3 µg/h melatonin (MOR + Mela). Fold changes are shown as compared to the saline-treated control.
