

**F1****LcrV**

**Figure S1.** Analysis of association between either cytokine secretion or proliferative response and a number of vaccinations with the LPV. PBMCs from immunized donors (n=18) were stimulated with recombinant F1 or LcrV (both at 5  $\mu$ g/ml), and supernatants were analyzed for IFN- $\gamma$ , TNF- $\alpha$ , IL-4, IL-10, and IL-17A levels. The correlation was estimated using Spearman's Rank Correlation coefficient. The Stimulation index (SI) was calculated against unstimulated cells. No correlation was revealed for all tested cytokines, as well as between proliferation (SI) and post-immunization time ( $p>0.05$ ).

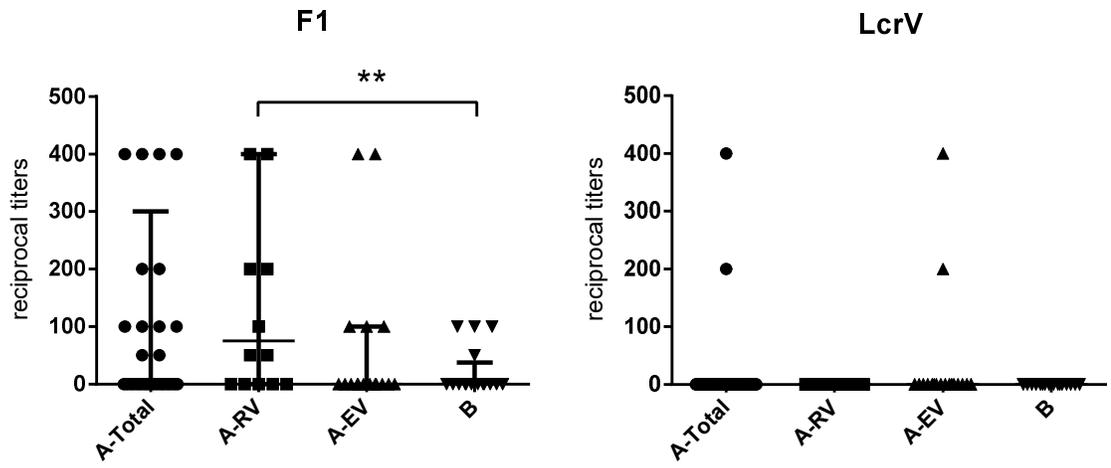

F1

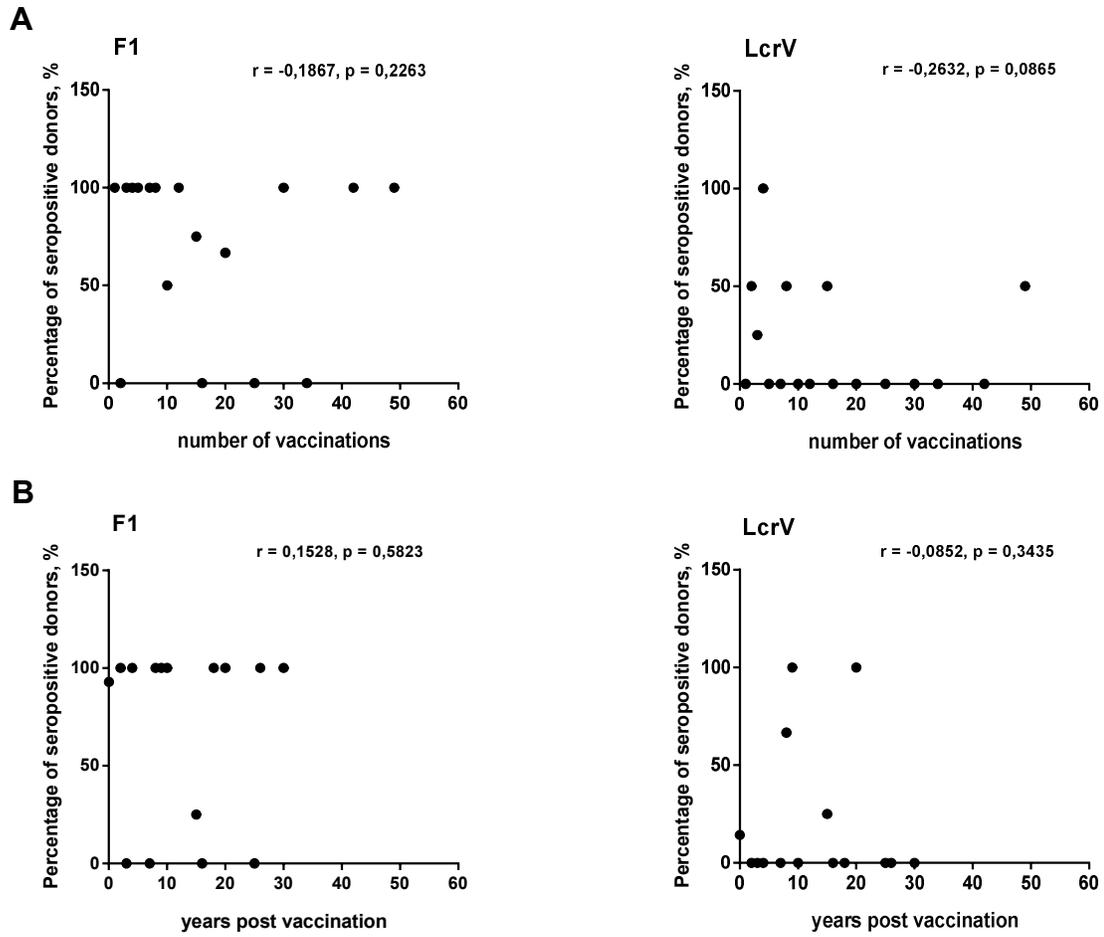

LcrV

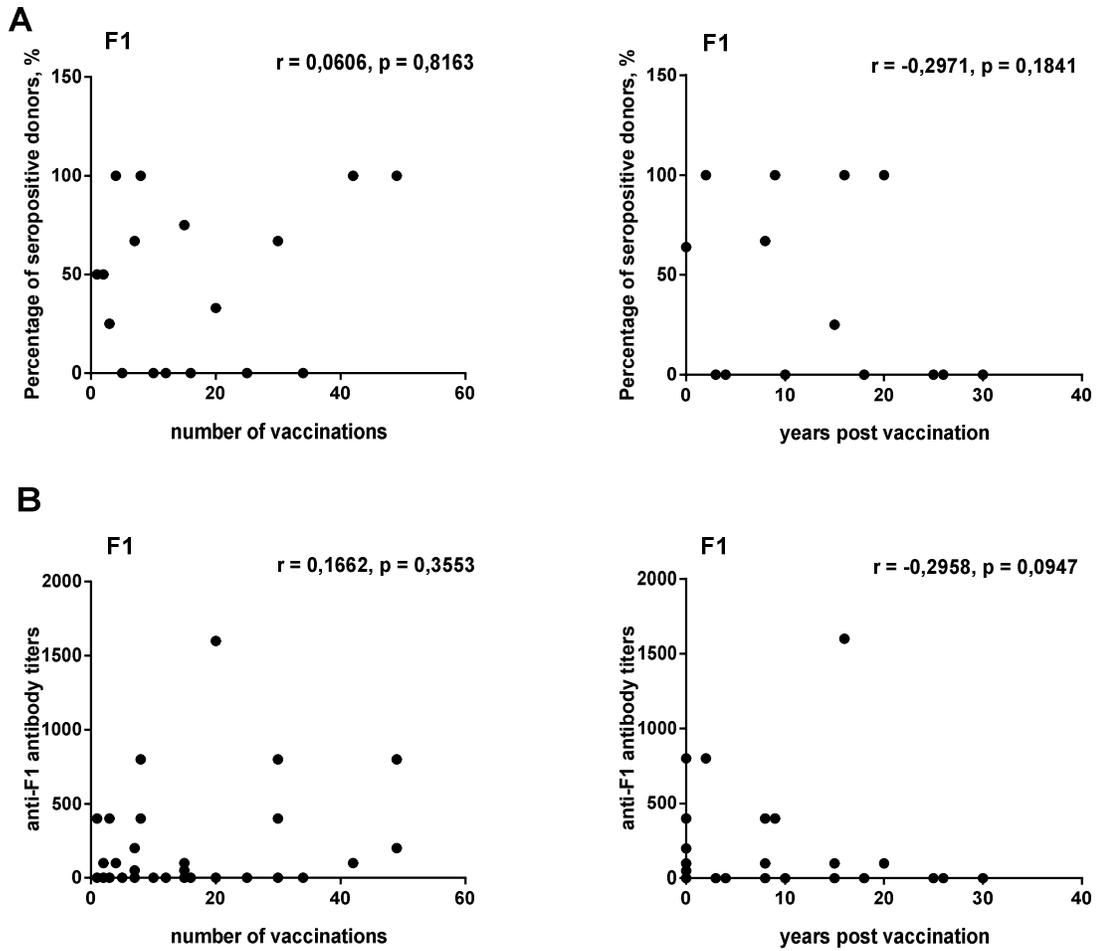

**Figure S2.** Analysis of association between cytokine secretion or proliferation and post vaccination time in years. PBMCs from immunized donors (n=18) were stimulated with recombinant F1 or LcrV (both at 5  $\mu$ g/ml), and supernatants were analyzed for IFN- $\gamma$ , TNF- $\alpha$ , IL-4, IL-10, and IL-17A levels. The correlation was calculated with Spearman's Rank Correlation coefficient. The SI was calculated against unstimulated cells. No correlation was revealed for all tested cytokines, as well as between proliferation (SI) and post-immunization time ( $p > 0.05$ ).

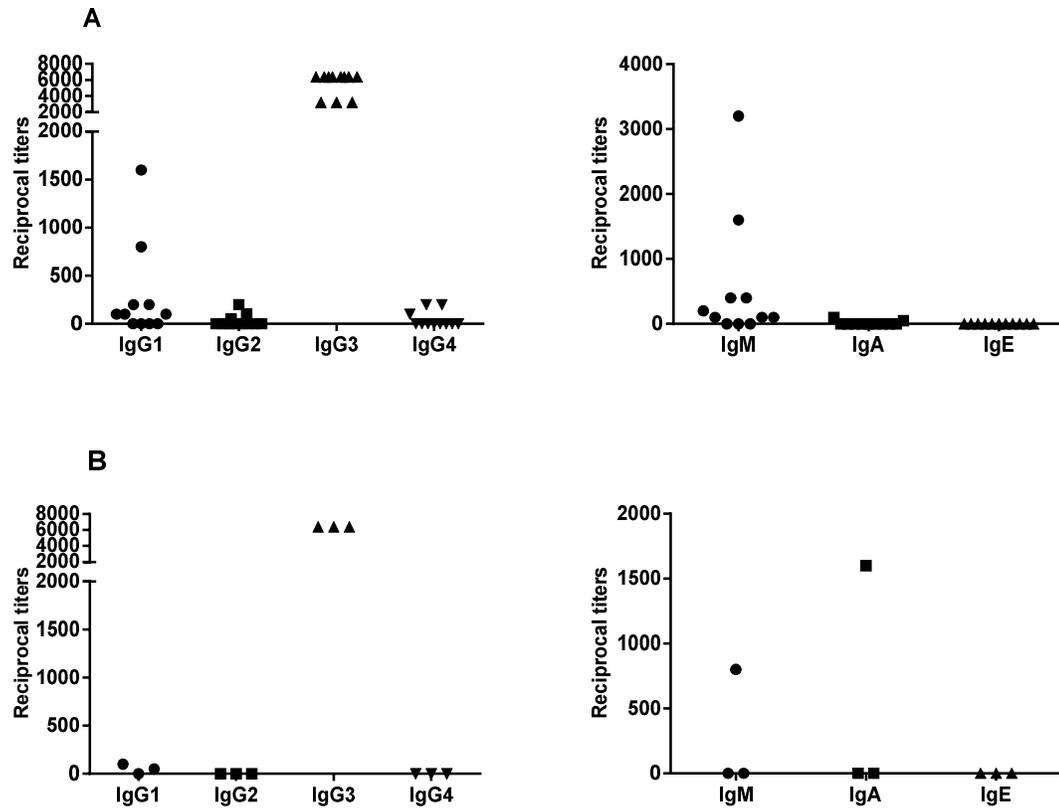

**Figure S3.** Serum antibody titers to F1 and LcrV antigens revealed by ELISA in sera obtained from vaccinees (groups A-Total, A-RV, A-EV) and naïve donors (group B). Difference between groups was analyzed by Mann-Whitney test; \*\* $p < 0.01$ .

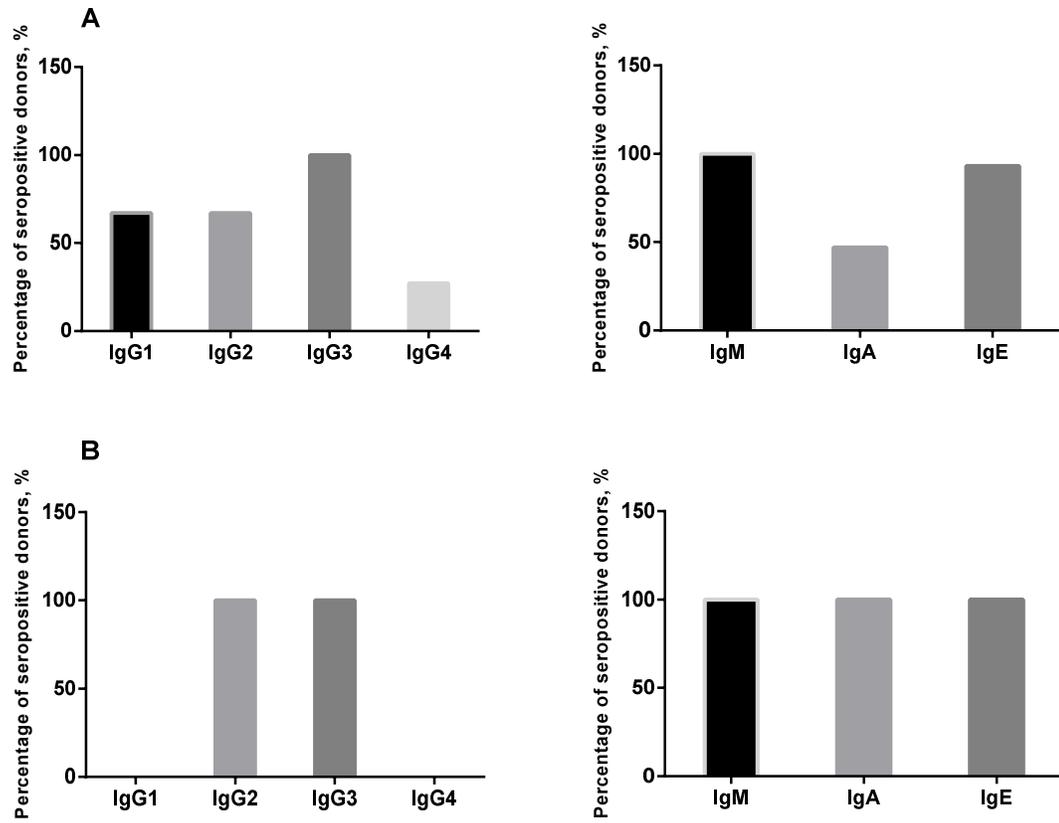

**Figure S4.** Analysis of correlations between percent of positive antisera revealed by immunoblot technique to either F1 or LcrV antigens: (a) number of vaccinations with LPV; (b) post vaccination time. Spearman's Rank Correlation Coefficient and p-value were calculated. No significant correlations were detected in all cases.

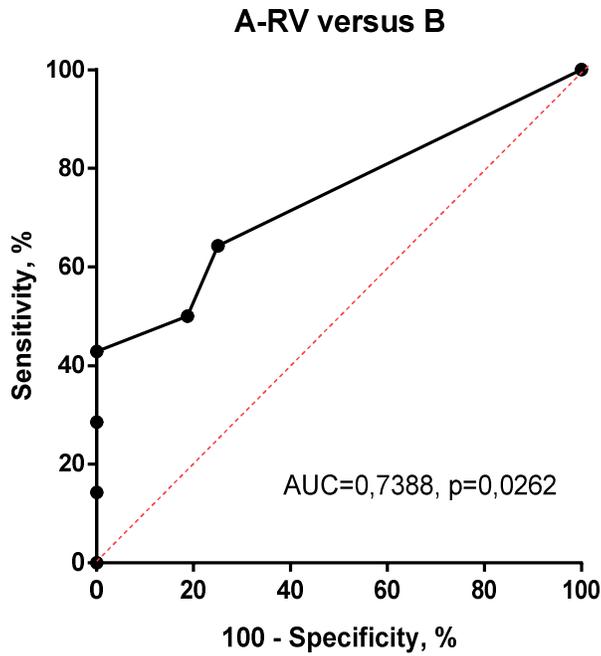

**Figure S5.** Analysis of correlations between number of vaccinations with LPV or post vaccination time: (a) percent of positive antisera to F1 revealed by ELISA; (b) anti-F1 antibody titers. Spearman's Rank Correlation Coefficient and p-value were calculated. No significant correlations were detected in all cases.

**Figure S6.** Distribution of classes and subclasses of anti-F1 immunoglobulins in vaccinees (A) and unvaccinated donors (B) detected in ELISA. Sera from 11 of F1-seropositive vaccinated and 3 unvaccinated donors were used for analysis.

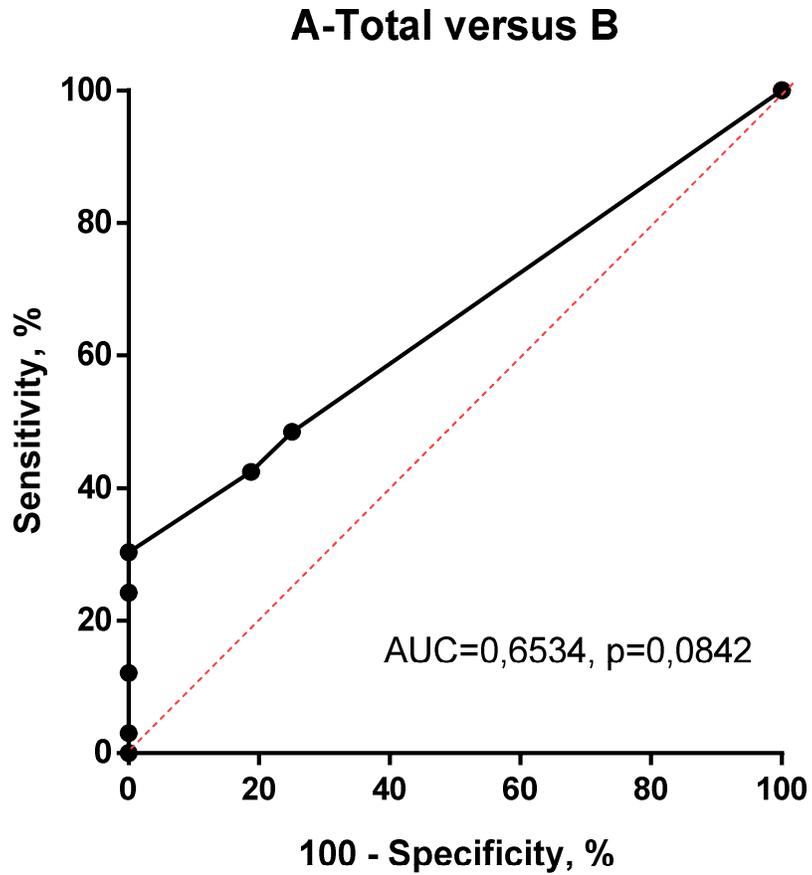

**Figure S7.** Distribution of classes and subclasses of anti-F1 immunoglobulins in vaccinees (A) and unvaccinated donors (B) detected by immunoblotting technique. Sera from 15 of F1-seropositive vaccinated donors and 1 unvaccinated donor were used for analysis.

|                      |        |                    |         | > 300.0  | 28,57          | 8,389 -<br>58,10 | 100,0          | 79,41-<br>100,0 | 28,57          |
|                      |        |                    |         | > 600.0  | 14,29          | 1,779-<br>42,81  | 100,0          | 79,41-<br>100,0 | 14,29          |

**Figure S8.** Receiver operating characteristic (ROC) analysis for anti-F1 serum antibody titers in group A-RV versus group B. ROC curve showed AUC=0,7388±0,09469 with p<0.05 indicating that anti-F1 antibody titers could discriminate recently vaccinated donors from unvaccinated controls. However, the maximum Youden's index was only 42,86 in case of cutoff = 150 with absolute specificity (100%), but low sensitivity (42,86%). AUC: area under the curve; SE: standard error; CI: confidence interval.

**Figure S9.** Receiver operating characteristic (ROC) analysis for anti-F1 serum antibody titers in group A-Total versus group B. In this case, anti-F1 antibody titers were not discriminating between all donors who ever have been received vaccination with the LPV and naïve control volunteers without LPV immunization ( $p > 0.05$ ). AUC: area under the curve.
