

Figure S5. Modulation of colorectal transcriptomic profile induced by exposure to HIV-1. Volcano plots of all genes detected by RNA microarray after 6 (a, b) or 24 h (c, d) of culture and comparing colorectal explants exposed to YU.2 (a, c) or NL4.3 (b, d) to those unchallenged (control). FC: fold change. Vertical dotted line is set at a Log₂FC = 0. Data shown are from two independent experiments performed with tissue from different donors. Full list of statistically modulated genes can be found in Table S2.
