15 **1. Results and Discussions**

16 *1.1. Porosity and mean pore size of TCPP/PSf membranes*

17 The porosity and average pore size of these TCPP/PSf membranes were also tested using  
18 classical weight loss method (see Figure S1). From Figure S1A, S1B and S1C, it can be seen that the  
19 overall porosity of TCPP/PSf membranes is decreasing, as the porphyrin content increases. Although  
20 the porosity does not show obvious change compared with the base membranes within a certain  
21 margin of error. This is due to the fact that TCPP was introduced after the formation of base  
22 membranes in this work, and the protonated TCPP content in TCPP/PSf membranes is very small  
23 (section 3.1), which is insufficient to affect the porosity of membranes. In addition, TCPP is a small  
24 dye molecule that has little effect on the pore size of the ultrafiltration membrane. Similarly, the  
25 addition of TCPP also has little effect on the mean pore size (see Figure 9C).

26

27

28 *1.2. Thermal stability of TCPP/PSf Membranes*

29 The thermal stabilities of B2 base membrane and B2 32:1 membrane were measured by  
 30 thermogravimetric analysis in nitrogen atmosphere (Figure S2). Results show both B2 base  
 31 membrane and B2 32:1 membrane are comparably stable about 450 °C. Difference shows up when B2  
 32 32:1 membrane starts to decompose at 480 °C, which is 20 C lower than the decomposition  
 33 temperature of B2 base membrane. This can be attributed to the decomposition of polysulfone  
 34 groups[1]. As the temperature further increases, the weight of B2 base membrane decreases faster  
 35 than that of B2 32:1 membrane. At 550 °C, the weight loss of B2 32:1 membrane is only about 40%,  
 36 but B2 base membrane has nearly 60% weight loss. This is mainly due to the fact that protonated  
 37 porphyrin itself is very stable at high temperature, and it reduces the decomposition rate of PSf. But,  
 38 the thermal stability of protonated porphyrins membranes is much higher than the application  
 39 requirement of water treatment membranes.
