

Figure S1. Case-dropping bootstrap strength of the Nonmotor Symptoms Scale in Parkinson's disease (NMSS) and Parkinson's Disease Questionnaire 39 (PDQ-39) summary index (number of bootstraps = 1000). Correlations of the strength centrality measure between the original sample and those of the subsamples with increasingly higher percentages of dropout cases were calculated. The 95% confidence interval of the correlation is indicated. The case-dropping bootstrap procedure showed that the CS coefficient of the node strength (CS (cor = 0.7) = 0.67) remained stable.

For every network in the eight subscales, the number of nonzero edges, predictability of each node representing the PDQ-39 subscale, and correlation stability coefficient (CS coefficient) of the strength centrality measure are given separately (number of bootstraps = 1000). The CS coefficient represents the maximum proportion of cases that can be dropped to retain a correlation of at least 0.70 with the original strength in at least 95% of the samples. CS coefficients > 0.5 indicate that the networks are stable.
