^a In these cases, patients had started with unilateral ophthalmoplegia or abduction palsy only, and then aggravated to bilateral ophthalmoplegia as disease progression.

^b In this case, only the presence of diplopia was recorded without evaluating the ophthalmoplegia. ^c In this case, MNCV, SNCV and F waves were normal, but H-reflexes were absent. ^d Gaze palsy, left. EO = external ophthalmoplegia; IO = internal ophthalmoplegia; CSF = cerebrospinal fluid = NCS = nerve conduction study; URI = upper respiratory infection; IVIG = intravenous immunoglobulin; GI = gastrointestinal infection; APN = acute pyelonephritis; AOM = acute otitis media; PP = plasmapheresis; ACTH = adrenocorticotrophic hormone; CHIKV = Chikungunya virus; B = bilateral; R = right eye; L = left eye; ab = abduction limitation only; MNCV = motor nerve conduction velocity; SNCV = sensory nerve conduction velocity; mo = month; wk = week.
