*p values are for the comparison with the referent model based on a likelihood ratio test. Model 1: crude model. Model 2: adjusted for age and sex. Model 3: model 2 + fish consumption and alcohol consumption. BIC, Bayesian information criterion. HR, hazard ratio.

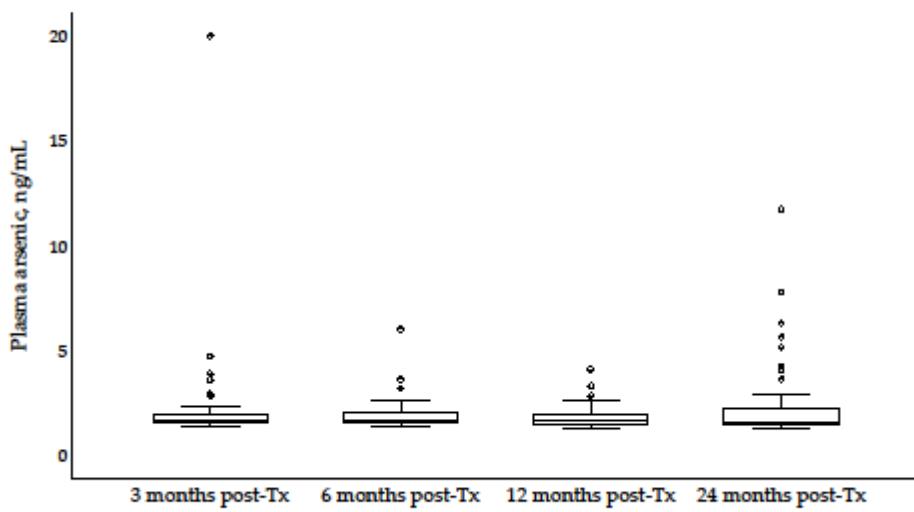

Figure 1. Plasma arsenic concentration of 46 kidney transplant recipients from the TransplantLines Prospective Cohort and Biobank Study (Eisenga, M.F.; et al. *BMJ Open* 2018, 8, e024502), at different follow-up visits after transplantation. Box plots show medians (interquartile range). Significance of potential change during follow-up visits was tested using the Kruskal Wallis test, which indicated no significant change over time ($p = 0.64$).
