UM: ultra-rapid metabolizer; RM: rapid metabolizer; NM: normal metabolizer; IM: intermediate metabolizer; PM: poor metabolizer; NC: normal clotter; IC: intermediate clotter; PC: poor clotter.

CNV: copy number variation; ¹CNV=1 + non-functional hybrid allele; ²CNV≥3.

Diplotypes for CYP2D6 were interpreted taking the copy number and the hybrid alleles into account in order to assess the number of functional alleles and to determine the activity score. Based on the activity score, diplotypes were classified into the following metabolic classes according to the CPIC interpretation notes: PM, IM, NM, and UM. The absence of any copy number signified to us the presence of a gene deletion (*5-allele).

Table S2. Comparison of triage (A), ADR seriousness (B), and condition at discharge (C) with metabolic phenotypes. Frequencies given in absolute numbers (percentages).

Phenotype	Red	Orange	Yellow	Green/ Blue	p-value
