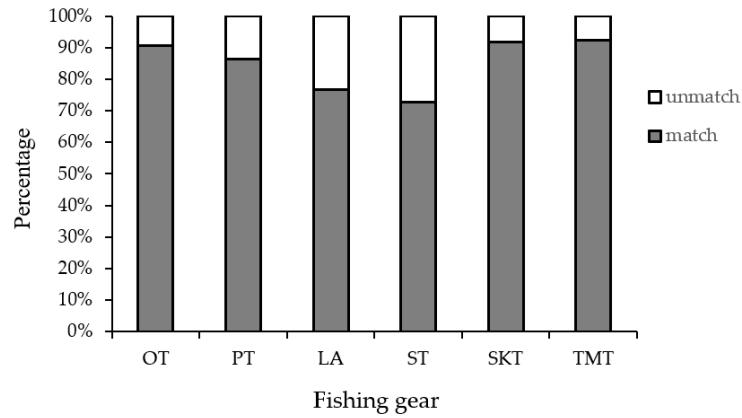

Figure 1. The percentage of landing data that matched with the VDR records for trips by fishing gear in the study period.

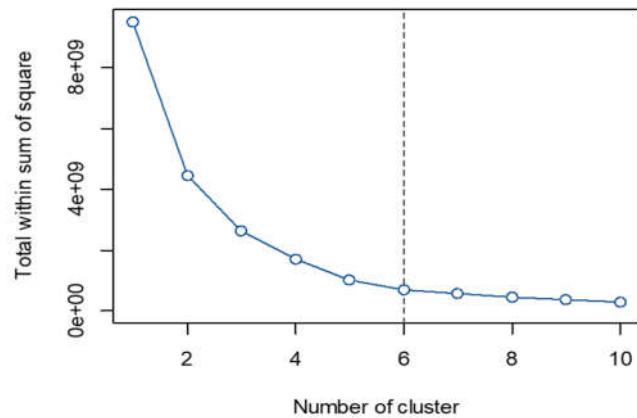

Figure 2. The scree plot of within cluster distance sum of squares.

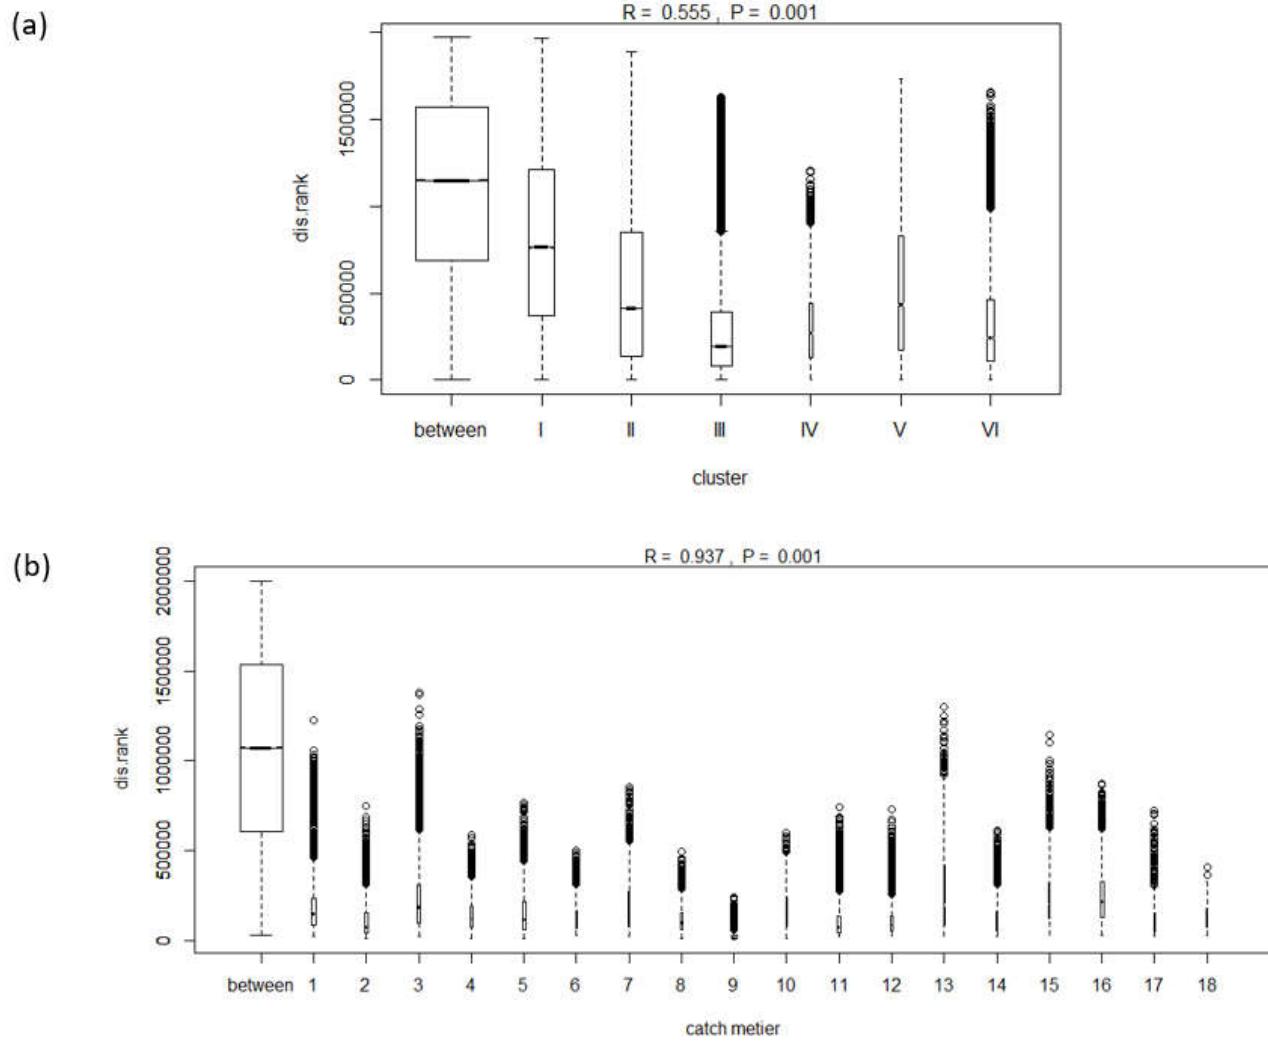

Figure 3. ANOSIM plot of the (a) 6 target group clusters and (b) 18 catch métiers with statistic R and *p*-value based on catch composition in landing data.

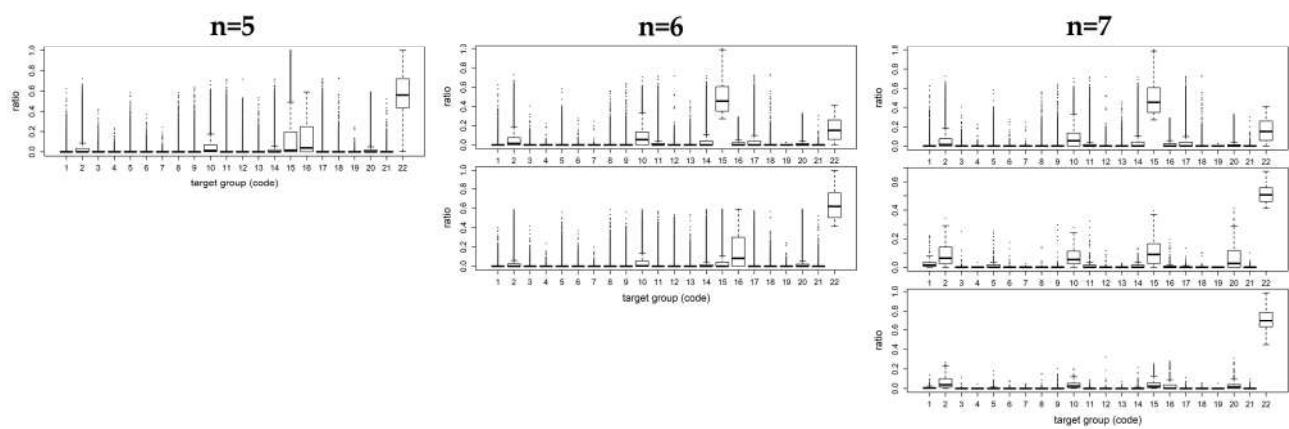

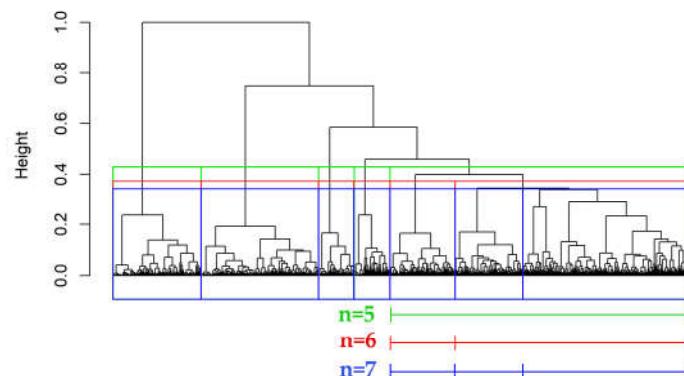

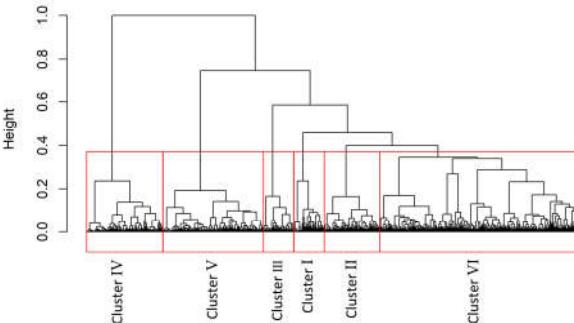

Figure 4. Diagram of change of target group composition profiles from different cluster numbers. The 6 clusters were determined to clearly separate the trips that mainly target cephalopods (code 15) and miscellaneous (code 22).

step 1

step 2

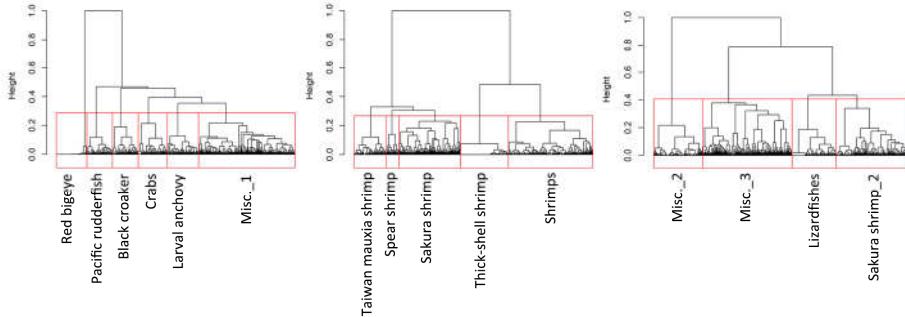

Figure 5. Diagram of the two-step clustering process. We determined 6 clusters and interpreted the group of trips to target homogenous fishery resources (low-resolution data of target group) in the first step. Given the huge number of trips and fuzzy hidden catch information in Clusters IV, V, and VI, cluster analysis was conducted using species composition in the second step.

Table 1. The species for the target group of the trawler fishery in coastal and offshore water off Taiwan. Target groups aggregated homogeneous species according to taxonomy (target group code 1-21). Species with low economic value but frequently caught are shown in the miscellaneous group (code 22). Main fishery resources are presented for the trawler fishery.
