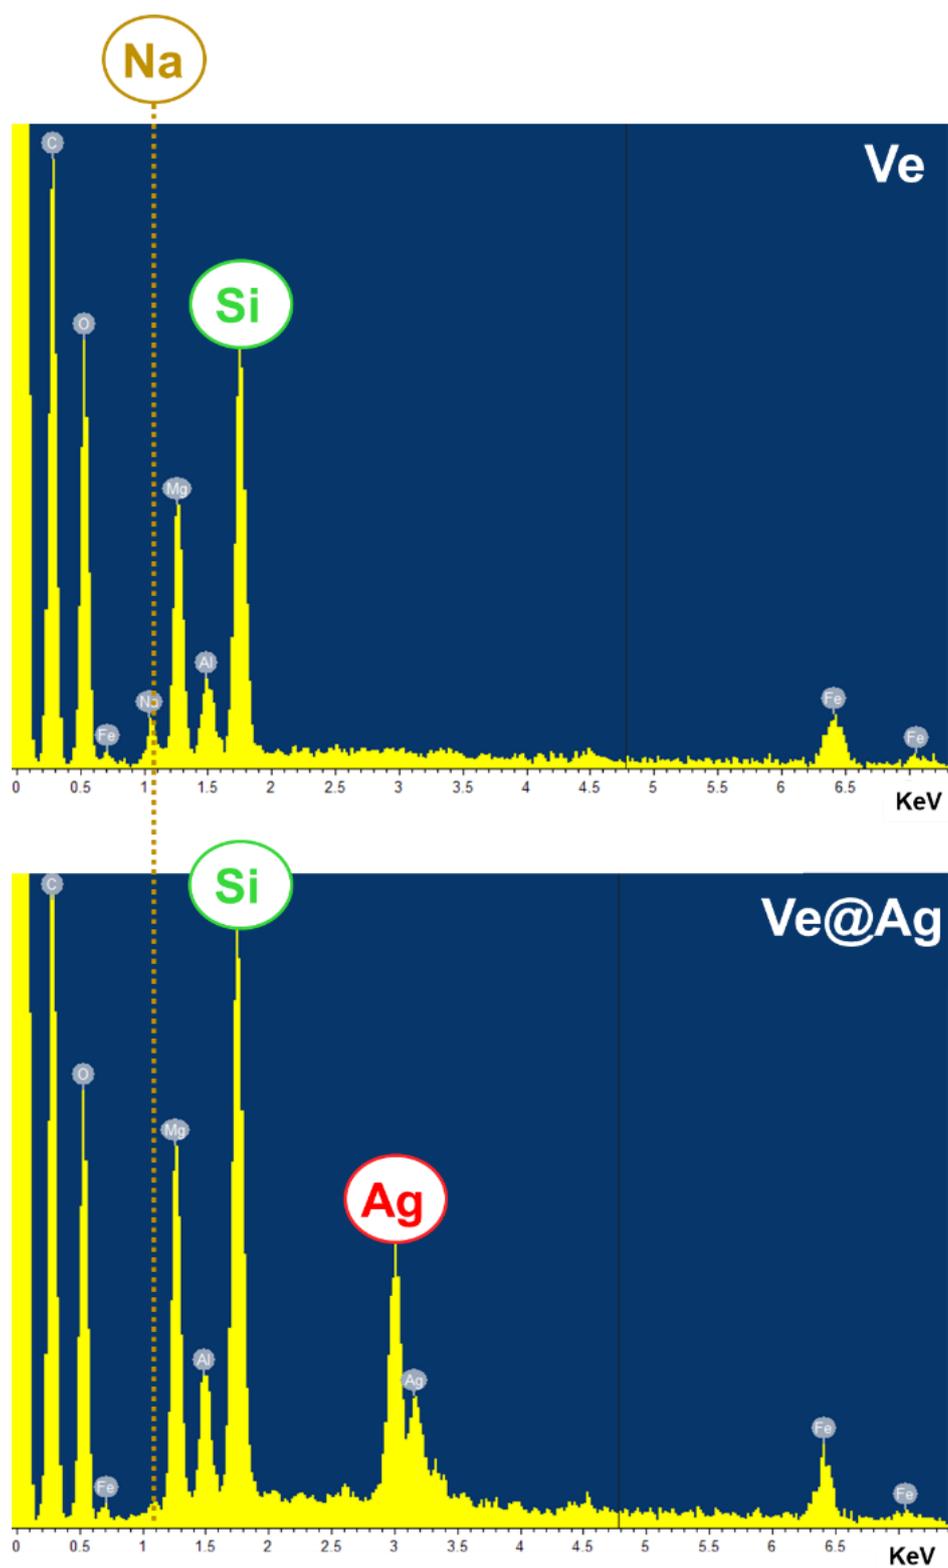

Figure S1. Energy-dispersive X-ray (EDX) spectra of vermiculite (Ve) and silver-coated vermiculites (Ve@Ag).

Sample	Ag/Si	Mg/Si	Al/Si	Fe/Si	O/Si	Na/Si
Vermiculite (Ve)	0	0.75	0.16	0.20	4.18	0.16
Ag-coated vermiculite (Ve@Ag)	0.31	0.78	0.22	0.19	4.19	0
Activated vermiculite (AVe)	0	0.68	0.24	0.19	4.17	0.17
Ag-coated activated vermiculite (AVe@Ag)	0.28	0.71	0.25	0.22	4.05	0

Table S1. Atomic ratios obtained from the ESEM-EDX characterization illustrated in Fig. 1 and S1.

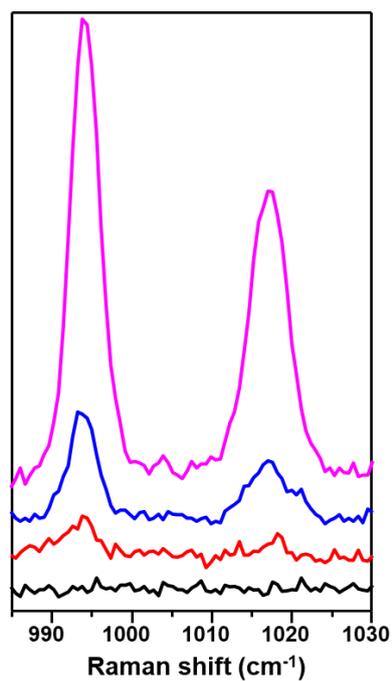

Figure S2. SERS detection of benzenethiol. Detail of the SERS spectra of hybrid Ag microstructures from activated vermiculite in the presence of decreasing concentration of BT, from the top to the bottom: 10 nM, 1 nM, 10 pM, 1 pM. SERS experiments were performed as follows. 5 μL of the Ag microstructures suspension were dispersed with 995 μL of BT aqueous solutions at decreasing concentrations. The samples were left under shaking for 2 hours, then the Ag microstructures were left to sediment. 980 μL of the supernatant were removed, and the microstructures were redispersed in suspension prior to the SERS analysis. SERS spectra were acquired with 20 seconds exposure time, 5 accumulations and by illuminating with a 633 nm laser.
