NMR spectra

¹H and ³¹P NMR spectra on GMO/F127/C-I and C-II samples were recorded after addition of water to GMO/F127/gold compound chloroform solutions taken to dryness and sonication. C-I and C-II were added at 10% w/w with respect to GMO.

¹H NMR spectra of GMO/F127, C-I and C-II in CDCl₃ are shown in Figures S1, S2 and S3 whereas those of the corresponding complexes are shown in Figures S4 and S5. Addition of D₂O induces the broadening of the signals Figure S6 and S7.

³¹P NMR spectra of C-I and C-II in CDCl₃ are reported in Figures S8 and S9 and no variation in the chemical shift is observed when dissolved in CDCl₃ also in the presence of GMO/F127 (Figures S10 and S11).

³¹P NMR signal of GMO/F127/C-I and C-II (Figures S12 and S13) disappears when the spectra are recording in D₂O likely because C-I and C-II compounds are not in solution but entrapped within the dispersed hexagonal phase.
