## 1. Dynamic light scattering measurements and data analysis

Screenshots from DLS measurements were obtained using Brookhaven BIC analysis software ver. 6.3 for BI 9000AT digital correlator (DOS version). Five independent measurements were performed for each Ag/surfactant system and each silver-to-surfactant molar ratio value. For each Ag/surfactant system and each molar ratio, the first screenshot provides the image of the autocorrelation function, and the second screenshot provides the data analysis.

The hydrodynamic diameter values of AgNPs shown in the plots in the main article were calculated as the mean of the value Eff.Diam. shown in the second screenshot. This value is calculated from the Taylor series expansion of logarithm of autocorrelation function  $g^{(1)}(t)$  in terms of cumulants as follows:

$$\ln(g^{(1)}(t)) = -\bar{\Gamma} t + \frac{1}{2!} \mu_2 t^2 + \dots$$

$\mu_2$  is the second cumulant which would be near zero for a perfect single exponential decay. The decay rate  $\bar{\Gamma}$  was calculated from the expansion of the logarithm of time correlation function up to the second term using the first linear

term in the series for the  $\bar{\Gamma}$  calculation (Gam.Ave. in the screenshots). The diffusion coefficient  $D$  was determined from

the decay rate ( $\bar{\Gamma} = D q^2$ ) and the hydrodynamic diameter of AgNPs (Eff.Diam. in the screenshots) was calculated from the diffusion coefficient using the Stokes–Einstein formula

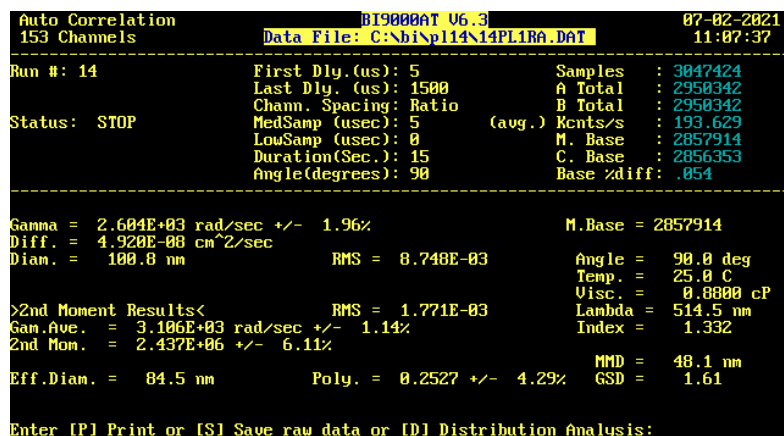

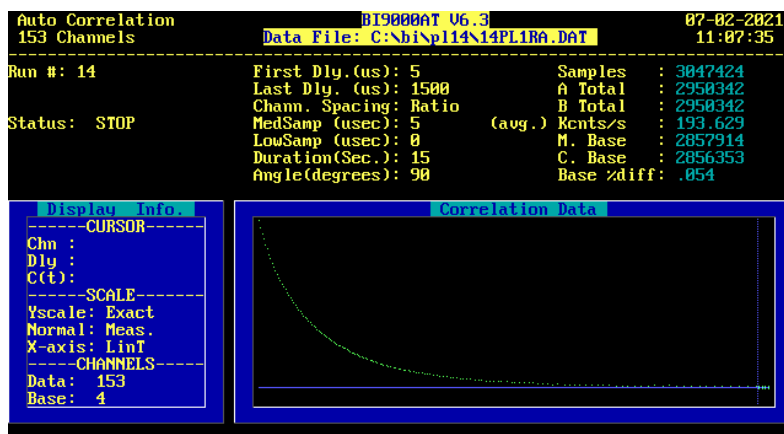

$$\text{Eff.Diam} = kT / (3\pi\eta D)$$

$\eta$  is solvent viscosity,  $k$  is the Boltzmann constant, and  $T$  is absolute temperature. Five independent measurements and calculations of time correlation function were carried out for each Ag/surfactant system and silver-to-surfactant molar ratio investigated. The mean value and standard deviation of Eff.Diam for each sample were calculated and plotted in the graphs.

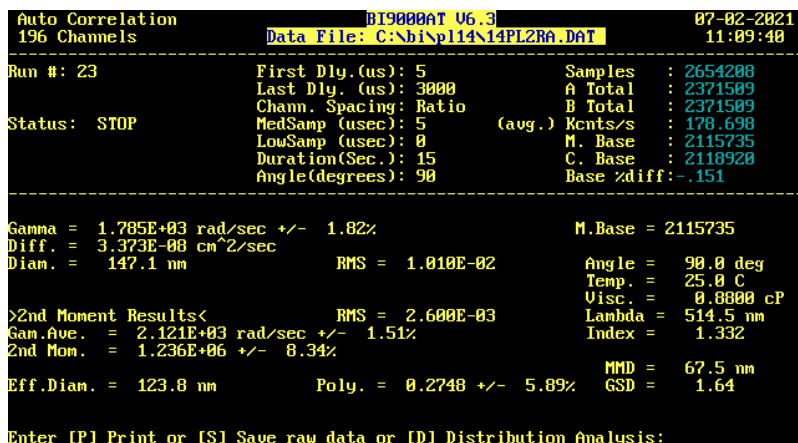

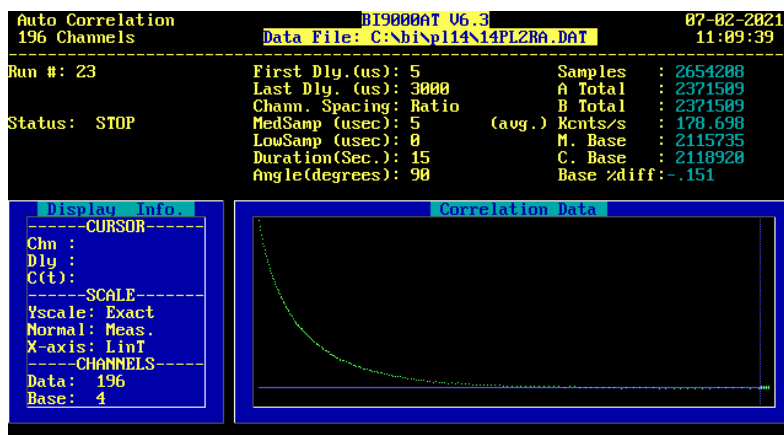

To reduce the excessive number of screenshots in this supplementary material, just one independent measurement for each Ag/surfactant system and each silver-to-surfactant molar ratio value is shown.

## 2. Zeta potential measurements

Screenshots of zeta potential peaks and the set of 10 repeated measurements are shown for each Ag/surfactant system and each silver-to-surfactant molar ratio value. The screenshots were obtained from the Brookhaven Instruments Zeta Potential Analyzer Software ver. 5.68. To reduce the excessive number of screenshots in the supplementary material, just single set of 10 independent readings of zeta potential for each Ag/surfactant system and each silver-to-surfactant molar ratio value is shown.
