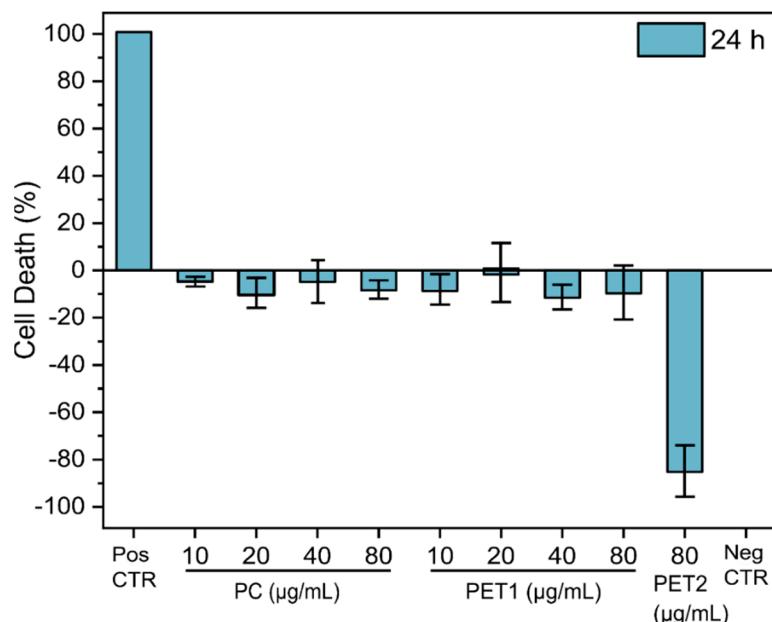

Figure S3. HepG2 cell viability after exposure to NPs at the concentration of 10, 20, 40, 80 $\mu\text{g/mL}$ for 24 or 48 h. In the case of PET2, data are represented only at 80 $\mu\text{g/mL}$ (LDH assay). Data are reported as % of cell death (average of three independent experiments \pm SD).

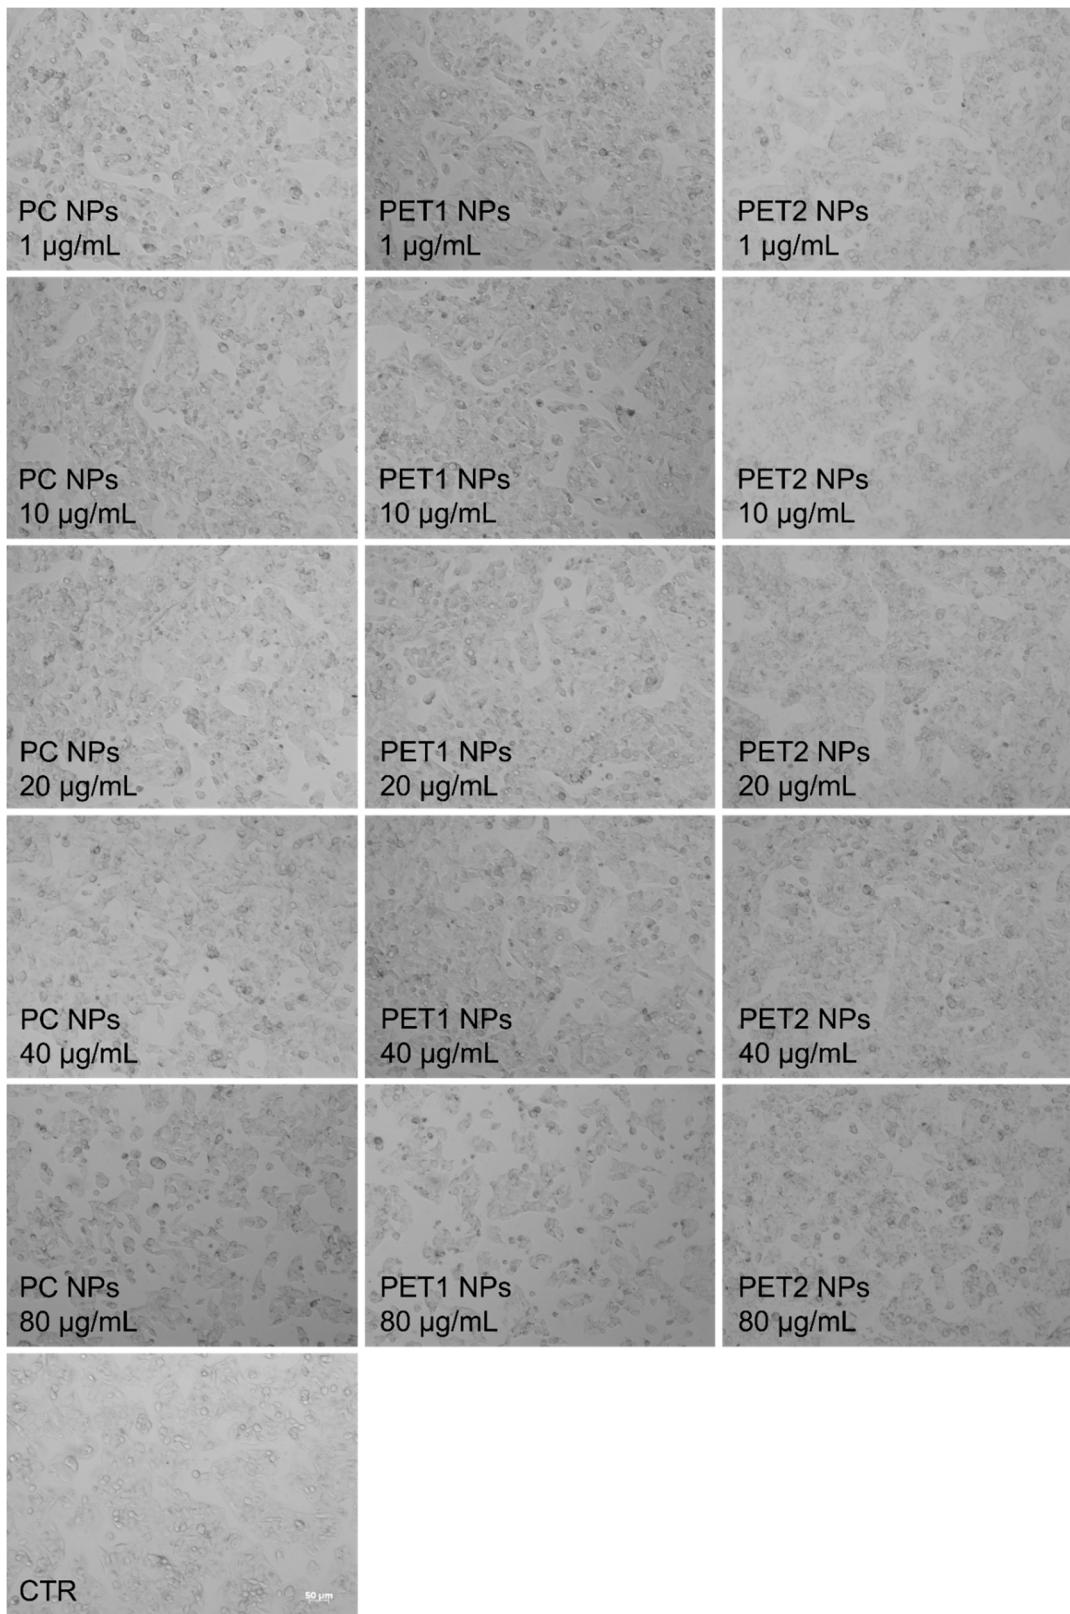

Figure S4. Representative morphological images of HePG2 cells after different treatments for 24 h.
Scale bar at 50 μm for all images.

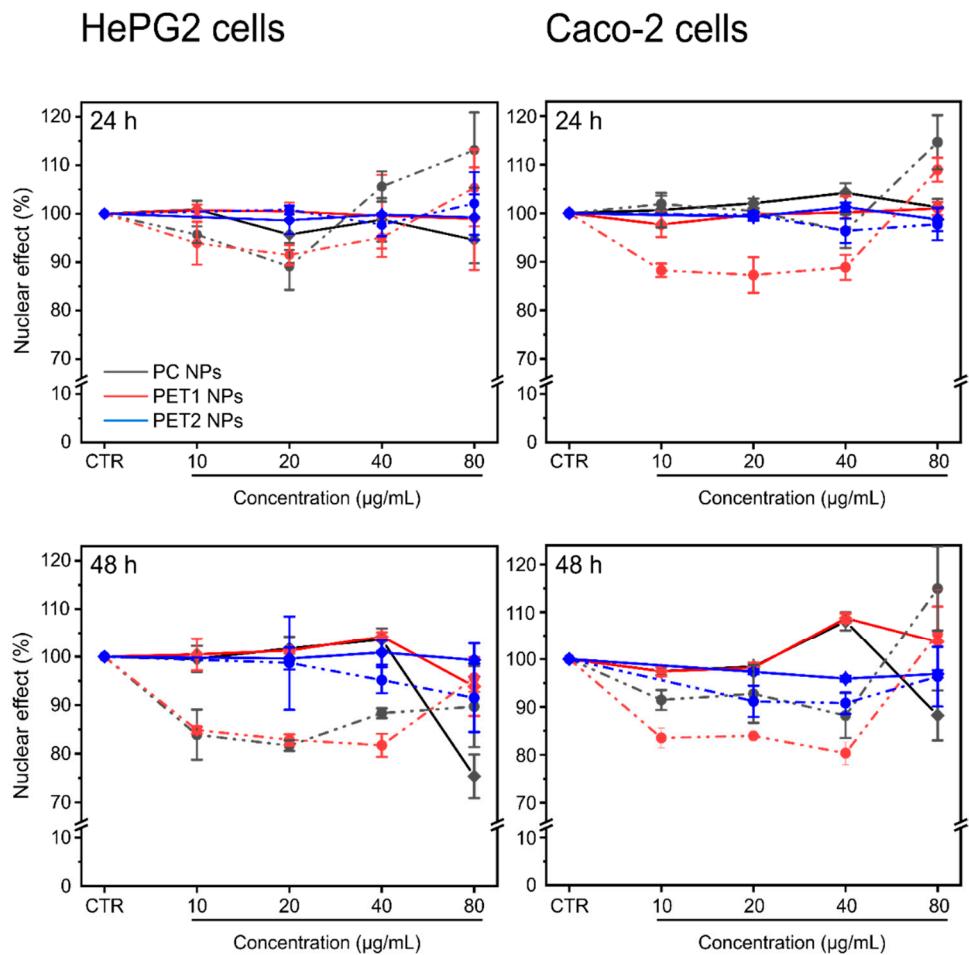

Figure S5. NPs effects on HePG2 or Caco-2 cells on nuclear size (line) and nuclear intensity (dash dot). Cells were exposed to PC, PET1 or PET2 NPs at concentrations between 10 and 80 $\mu\text{g/mL}$ for 24 or 48 h, stained with Hoechst 33342 and analyzed by HCl. Data are expressed as % nuclear effect normalized to the control (untreated cells) and reported as mean of three independent experiments $\pm \text{SD}$.
