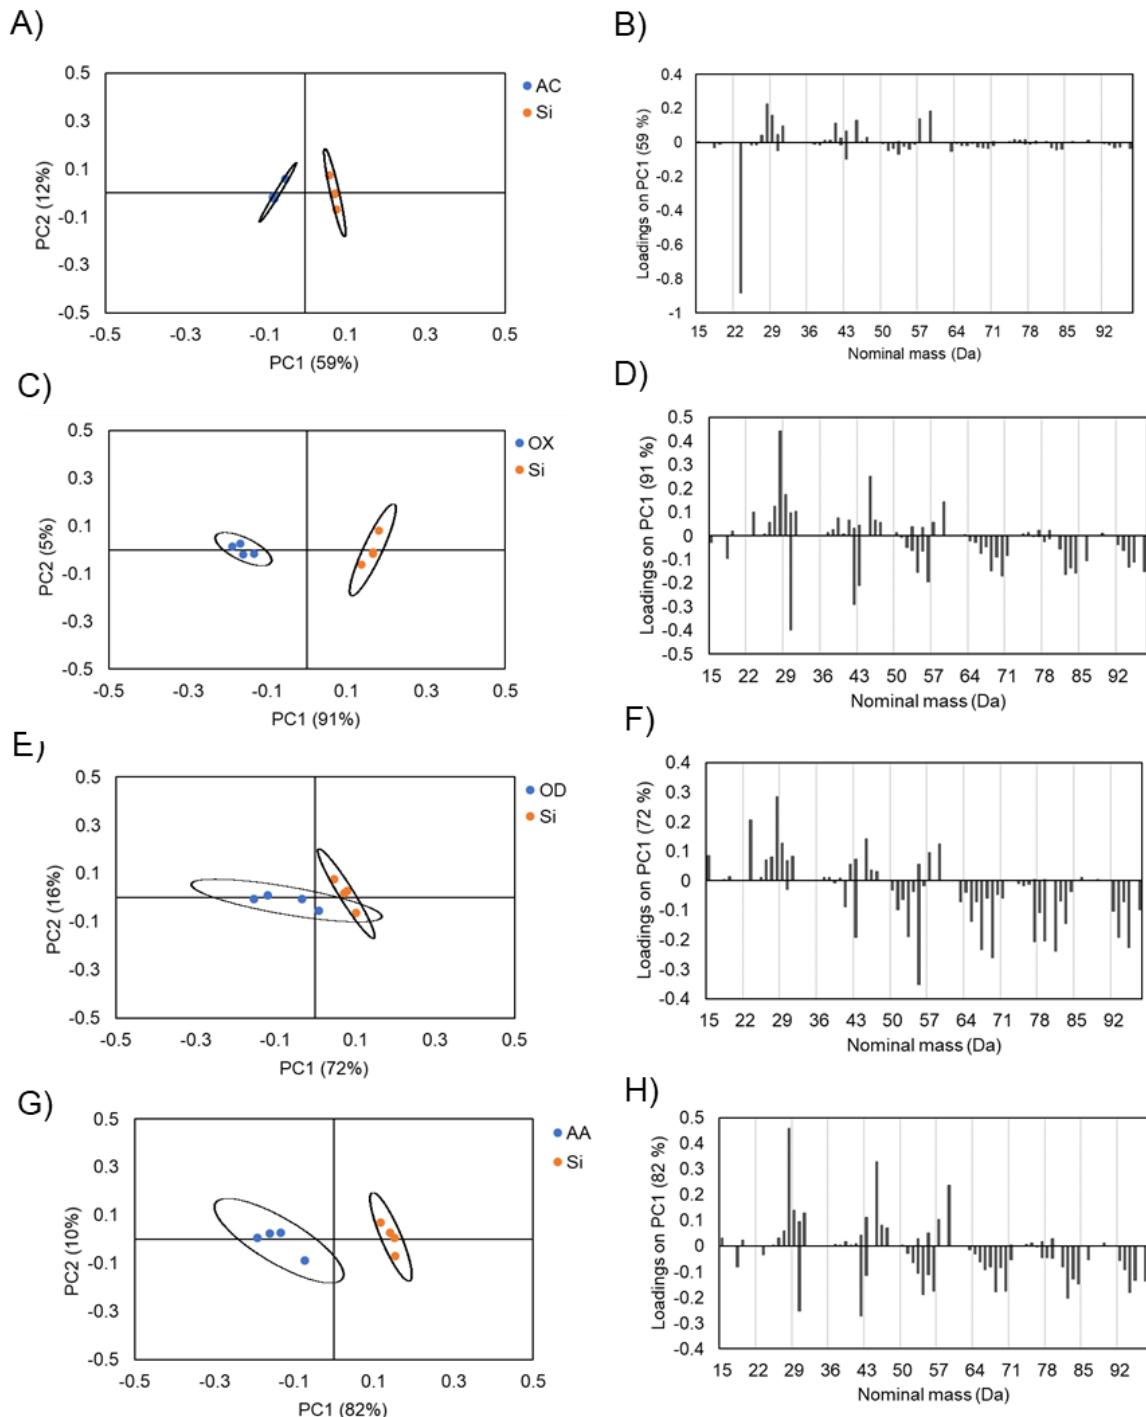

Figure S1. Principal component analysis of ToF-SIMS characterization data showing discrimination of bare SiO₂ and plasma polymer functionalities for AC A) OX C) OD E) and AA G). TOF-SIMS PC1 loadings for all fragments below 100m/z for AC B) OX D) OD F) and AA H).

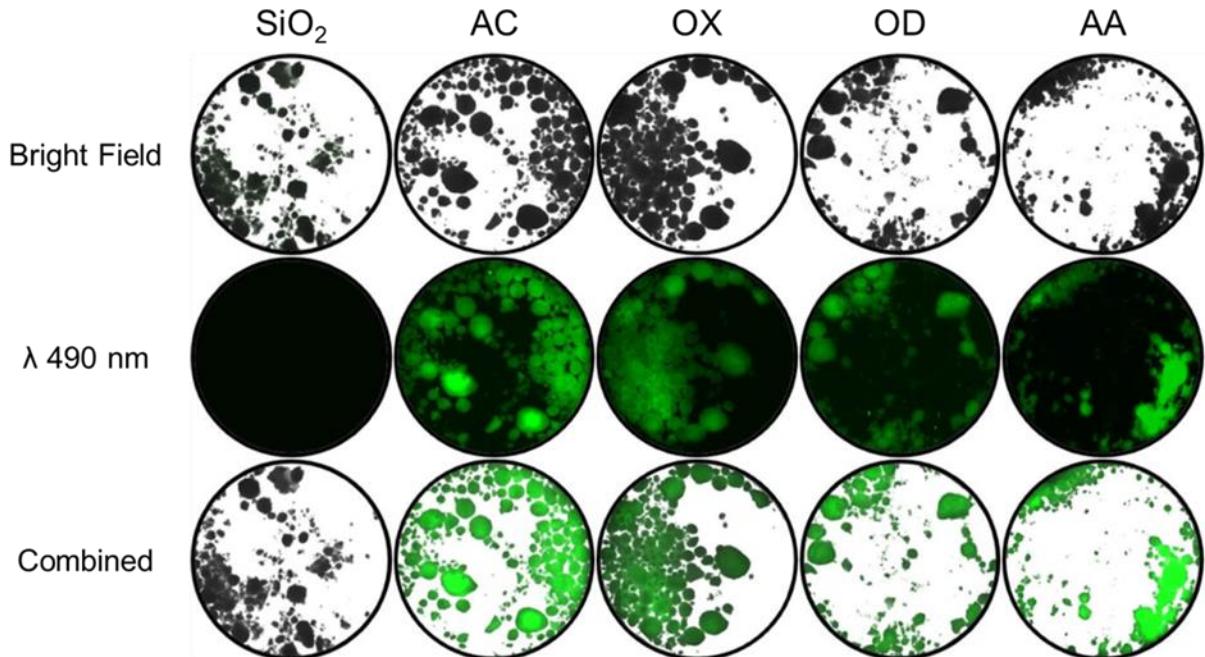

Figure S2. Autofluorescence analysis of Plasma polymer coated silica nanoparticles in bulk. Polymer coatings shown as green in signal channel and combined images.

The success of the nanoparticle functionalisation was first validated via fluorescence microscopy. Indeed, plasma polymers are rich in double bonds, a singular chemistry conferred by the ions and radicals present in the plasma phase during film deposition. The unsaturation and autofluorescence phenomena is related to the abstraction of radical H^{*} from monomer precursors and subsequent radical self-quenching [77]. Plasma polymers autofluorescence has previously been used by others to determine the chemical stability of plasma coatings [78]. Fluorescence microscopy therefore constitute a swift approach to corroborate the presence of plasma polymer coatings on the nanoparticles. In bright field images, all nanoparticles appear black. Following excitation at 490 nm, the autofluorescence of bulk plasma modified particles SiO₂ nanoparticles (PPSiNP) is green, while the bare SiNP are not visible. The merged images of both optical channels shown in Figure S2 confirm the successful coating of the nanoparticles with AC, OX, OD and AA.

A)

Si					
AC	288 (97.3%)				
POX	287 (97.6%)	293 (99.0%)			
OD	288 (98.6%)	292 (98.6%)	290 (98.3%)		
AA	285 (97.9%)	287 (96.6%)	286 (96.9%)	287 (98.0%)	
	Si	AC	OX	OD	AA

B)

Si					
AC	288 (97.3%)				
POX	287 (97.6%)	293 (99.0%)			
OD	288 (98.6%)	292 (98.6%)	290 (98.3%)		
AA	285 (97.9%)	287 (96.6%)	286 (96.9%)	287 (98.0%)	
	Si	AC	OX	OD	AA

Figure S3. Relational table of the identified proteins in the plasma A) and serum B) coronas of all five bare and surface modified silica nanoparticles.

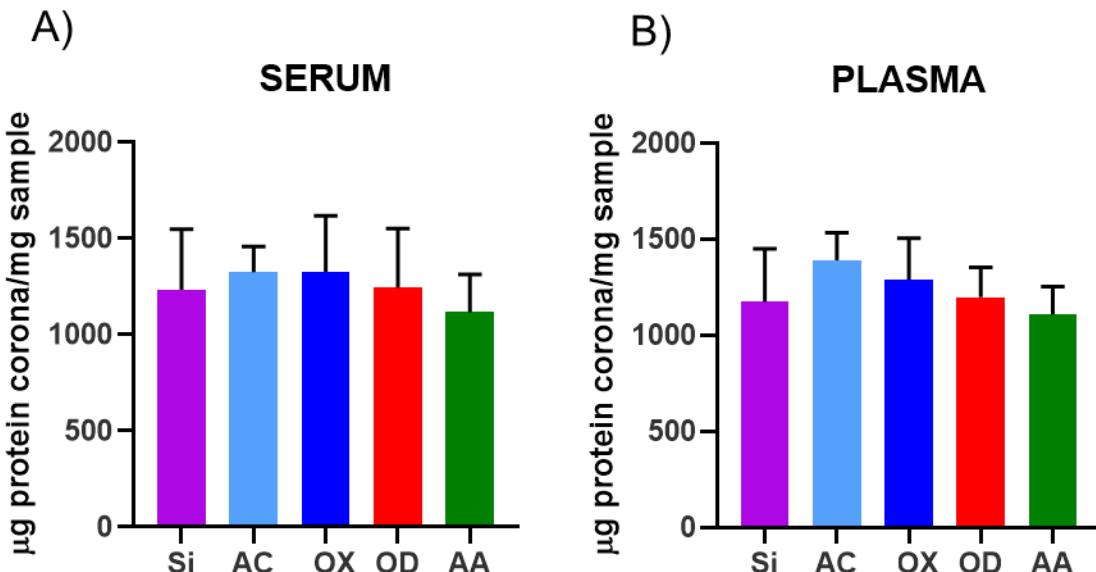

Figure S4. Total proteins desorbed from the coronas of the bare and modified silica nanoparticles quantified by Pierce assay on Serum A) and Plasma B).

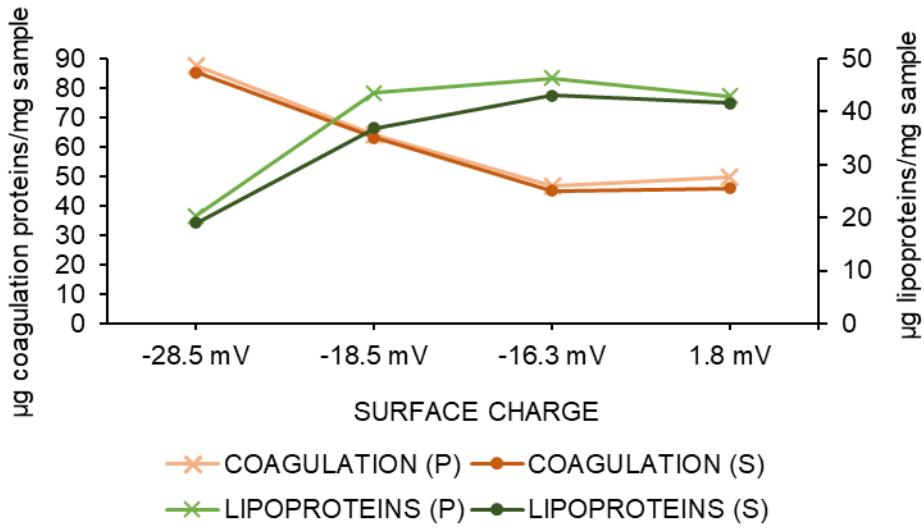

Figure S5. Relation of amount of coagulation proteins and lipoproteins adsorbed on the particles corona from plasma (P) and serum (S) with the nanoparticles surface charge.

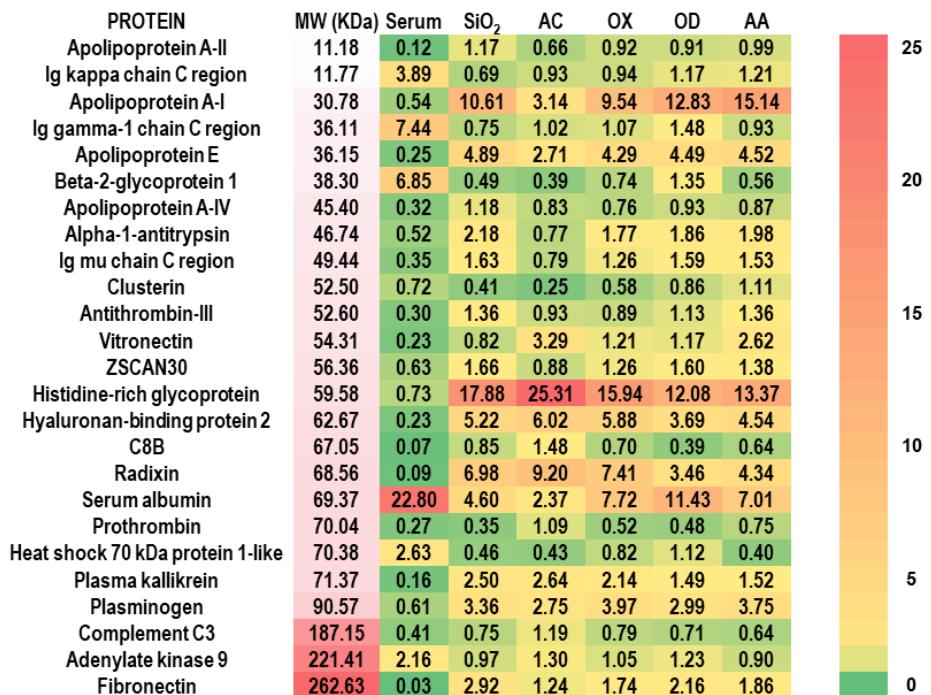

Figure S6. Heat map of major protein components of serum protein corona formed on PPSiNPs sorted against increasing protein molecular weight (MW).

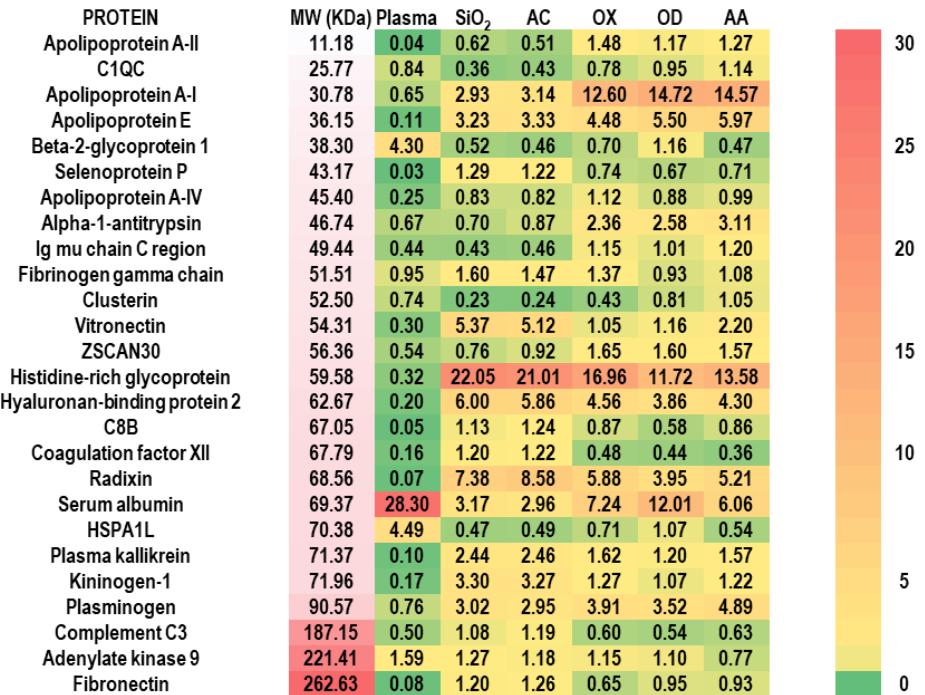

Figure S7. Heat map of major protein components of plasma protein corona formed on PPSiNPs sorted against increasing protein molecular weight (MW).

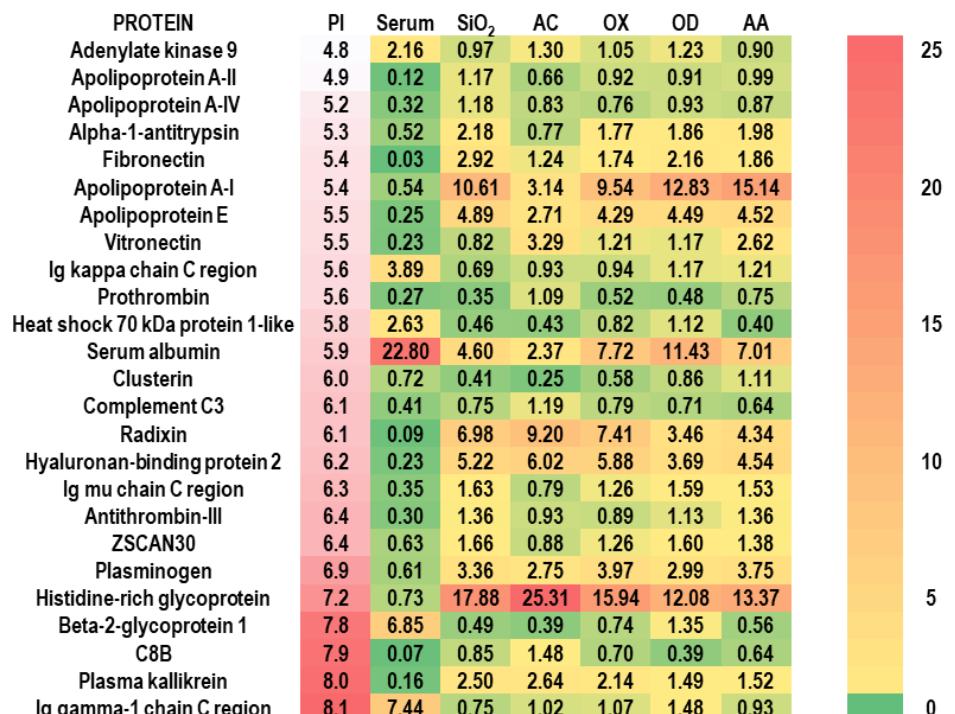

Figure S8. Heat map of major protein components of serum protein corona formed on PPSiNPs sorted against increasing isoelectric point (PI). The protein analysis by PI shows no correlation to the protein corona.

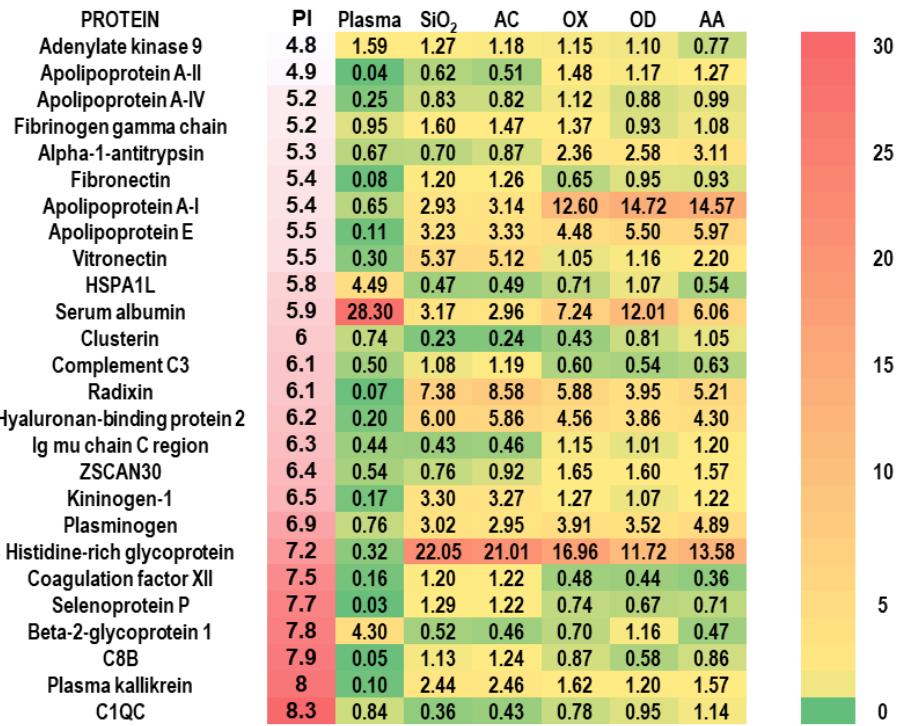

Figure S9. Heat map of major protein components of plasma protein corona formed on PPSiNPs sorted against increasing isoelectric point (PI). The protein analysis by PI shows no correlation to the protein corona.

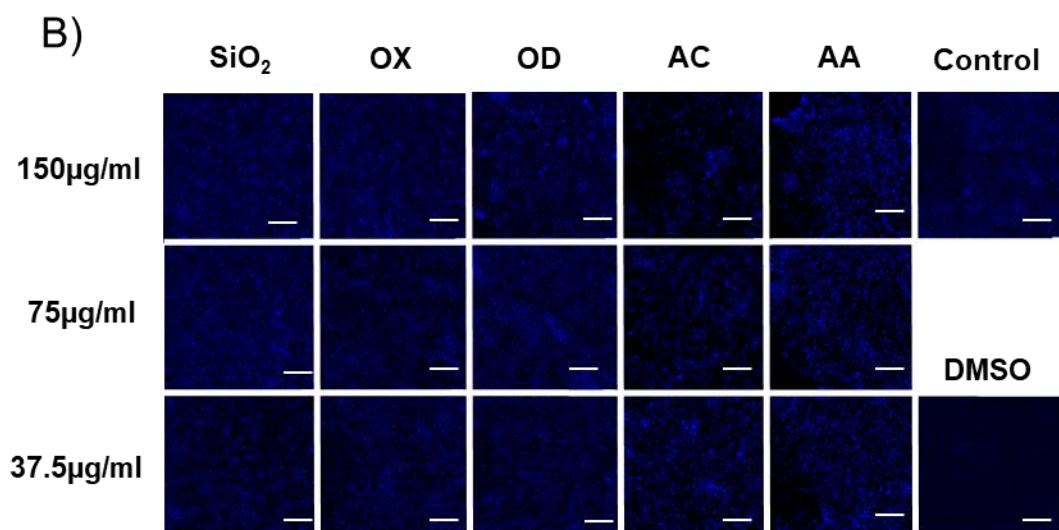

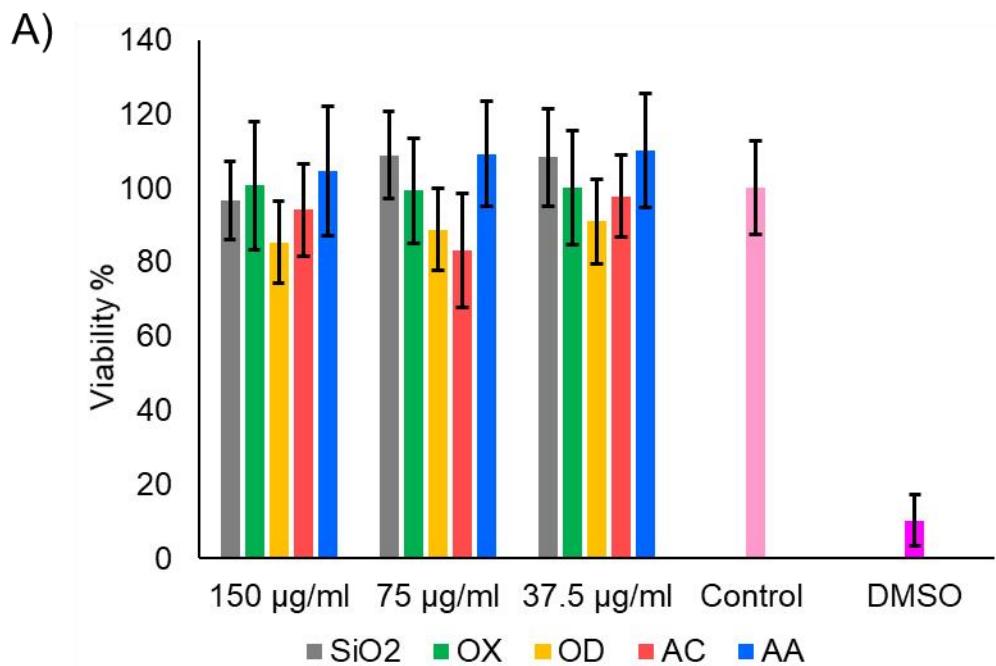

Figure S10. Cell viability evaluation of SiNP, POx, OD, AC, AA samples at different concentrations for 24 h on HFFs by resazurin assay A). Representative fluorescent microscopy images of cells after 24 h exposure to SiNP, POx, OD, AC, AA samples at different concentrations along with untreated and DMSO controls (scale bars 500 µm) B).

Table S1. List of all corona proteins identified by LC-MS. Average of the molar percentage of total protein unbound from each PPSiNPs type from plasma (P) and serum (S).
