

# ZnO nano-rod devices for intradermal delivery and immunization

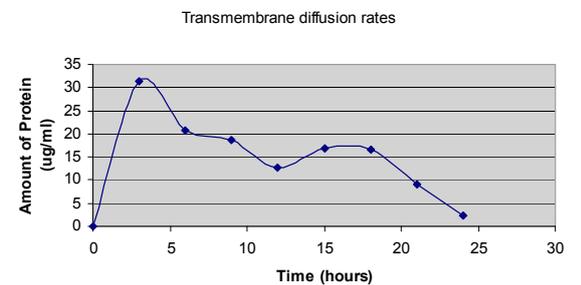

Tapas R. Nayak<sup>1</sup>, Wang Hao<sup>2</sup>, Aakansha Pant<sup>1</sup>, Minrui Zheng<sup>3</sup>, Hans Junginger<sup>1</sup>, Wei Jiang Goh<sup>1,4</sup>, Choon Keong Lee<sup>1</sup>, Shui Zou<sup>1</sup>, Sylvie Alonso<sup>5</sup>, Bertrand Czarny<sup>6</sup>, Gert Storm<sup>7</sup>, Chong Haur Sow<sup>3</sup>, Chengkuo Lee<sup>2\*</sup> and Giorgia Pastorin<sup>1,3,8,\*</sup>

## Supplementary Materials

**Figure S1.** Left: example of a tube furnace for CVD. Right: Schematic representation of CVD process with zinc nanorods. Chip is inserted at a defined length from a pile of zinc oxide-graphite and the center is heated to 850°C. With vacuum, a slight pressure of NOx gas is allowed to reside in the chamber and the vaporized zinc oxide deposits on the chip to form nano-rods.

Sample (every 3 hours)	Prot (µl)	Average OD at 595 nm (x10 <sup>-3</sup> )	Protein concentration n (µg/ml)	Total quantity of Protein (µg)
Blank	0	0.00	0.0	0.0
3 hrs	20	6.39	31.4	47.10
6 hrs	20	4.22	20.7	31.05
9 hrs	20	3.81	18.7	28.05
12 hrs	20	3.05	12.7	19.05
15 hrs	20	3.46	16.9	25.35
18 hrs	20	3.38	16.6	24.90
21 hrs	20	1.86	9.1	13.65
24 hrs	20	0.46	2.3	3.45
				Total: 192.60

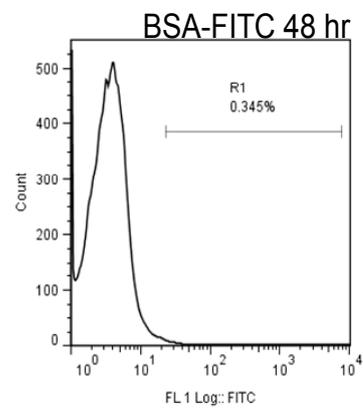

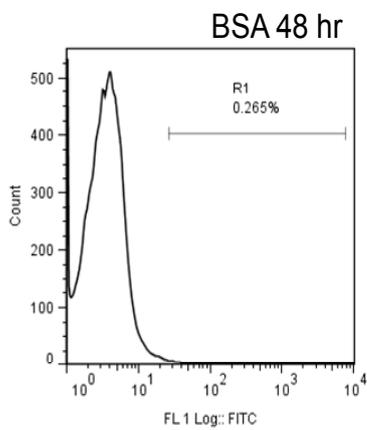

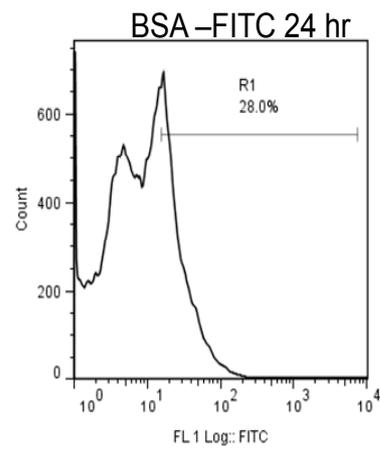

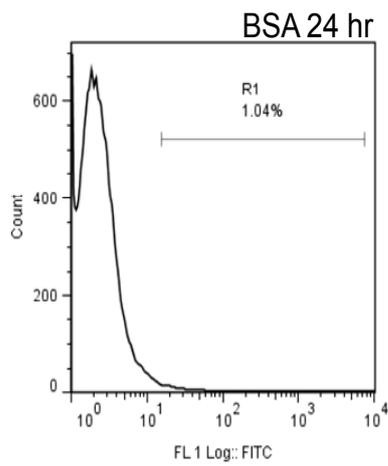

**Table T1:** Bradford quantitative albumin-FITC protein assay after skin penetration, calculated from the fluids collected every 3 hours.

Protein sample	OD (595nm)	Average OD	Protein quantity(mg)
Protein sample before adsorption on to chip (stock solution)	0.9486 0.9463 0.9545	0.9498 (SD 0.004)	5.397
Protein sample after adsorption onto chip	0.8012 0.7982 0.7967	0.7987 (SD 0.002)	4.544
Protein adsorbed onto the chip	-		0.853
Protein sample from washing of chip	0.0431 0.0461 0.0479	0.0457 (SD 0.002)	0.302
Protein sample collected from receptor chamber			0.193

17 **Table T2:** Analysis of quantity of albumin-FITC adsorbed on to the chip and amount released  
18 into the skin during the *in vitro* skin penetration study by Bradford assay. Where possible,  
19 the experiments were repeated in triplicates.

25

26 **Figure S2:** Antigen migration to the lymph nodes. After 24 hr the antigen BSA-FITC is  
 27 delivered to the lymph nodes by dendritic cells in the immune system and this time point was  
 28 taken as a reference while using the nanochips.

**Table T4.** Total anti-OVA serum IgG titres at day 14 after intradermal priming with chips at day 7 and day 14 after sub-cutaneous booster immunization. Strangely, anti IgG antibody titres were not detectable for the PBS-SC4 sample after 14 days post-boost.
