Figure S1. The chemical structure of the PB-*b*-PDMAEMA (A) and the cryo-TEM micrograph of the PB-*b*-PDMAEMA micelles in 50 mM sodium phosphate ($c = 2.5$ g/L) at pH 7.0 (B).

Figure S2. The TEM images of the AgNPs/PB-*b*-PDMAEMA hybrids taken from different places of the sample at different magnification.

Figure S3. The TEM images of the control AgNPs sample that was synthesized under the same conditions in the absence of the PB-*b*-PDMAEMA micelles.

Figure S4. The SERS spectrum of 4-MPBA with characteristic vibrations. Inset: the chemical structure of 4-MPBA. The peak at 1070 cm^{-1} , which is related to the in-plane benzene ring breathing mode coupled with the C-S stretching mode, was used as an analytical signal for the SERS experiments. Conditions: an aqueous solution of 4-MPBA with the concentration of $30\text{ }\mu\text{M}$ was mixed with the sample of the AgNPs/PB-*b*-PDMAEMA hydrid in a 1:1 ratio, after 30 minutes a $10\text{ }\mu\text{l}$ aliquot of the mixture was applied onto aluminium foil and the SERS spectrum was acquired.
