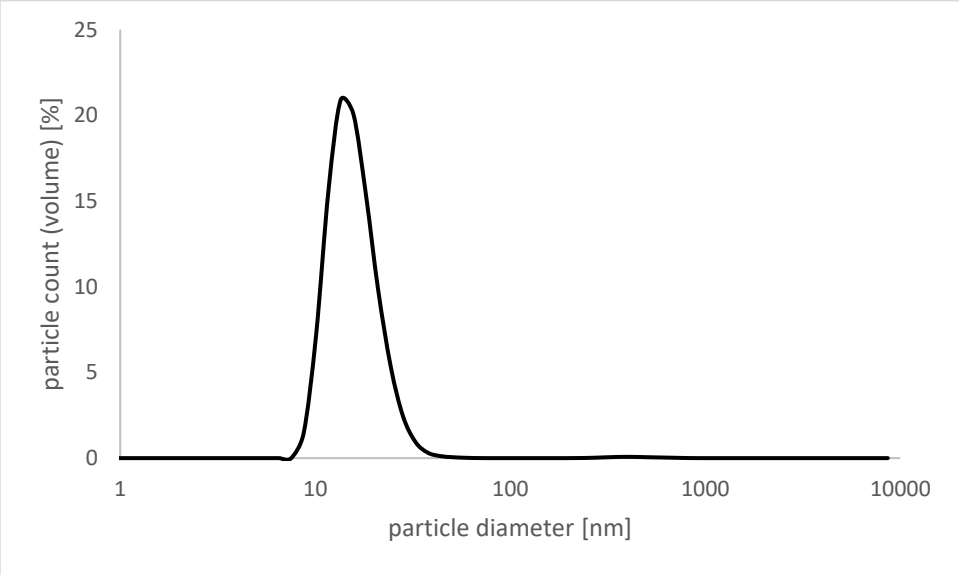

Figure S1: Size distrubution of commercial gold nanoparticles (Sigma) after 4-fold dilution with physiological PBS (pH = 7.4) based on DLS measurements.

Table S1. Absorbance of crystal violet in destaining solutions used for assessment of the amount of bacteria at the tested surfaces.

–	G	GSHGG	GSHAuGG
Sample surface area [cm²]	0.400	0.480	0.550
Directly measured absorbance of dye bound to bacteria	0.092	0.111	0.255
Signal expressed per 1 cm² after subtracting the signal for the unmodified glass	0.00000	0.00125	0.23364
increment	–	–	186.91
