

Supplementary Material S2: Hierarchically arranged percentages (%) of the maximum possible scores achieved regarding the medicinal-cosmetic potential of the local endemic plants of Crete, Rif-Mediterranean coast of Morocco and Tunisia (Level I evaluation) outlining blue cell cases (Highest: >70%), green cell cases (above average to high: 55-70%), yellow cell cases (above average: 50-55%), grey cell cases (below average to low: >35-50%) and no colour cases (lower: <35%). For each taxon score values regarding feasibility for sustainable exploitation (Level II evaluation) and characterization about readiness timescale for value chain creation (Level III) are retrieved from (Krigas et al. 2021).
