Note: S = susceptible; I = intermediate; R = resistant. The susceptibility of the strain AbY-1805 to antibiotics (Hangwei, Hangzhou, China, except for oxytetracycline and florfenicol)

was tested by using disk-diffusion method followed Kirby-Bauer disk diffusion method and the standard techniques of the Clinical and Laboratory Standard Institute (CLSI) [102,103]. Briefly, the disks were dispensed on the surface of the RO agar medium that was mixed with the strain AbY-1805, and incubated at 28 °C for 24 h. Diameters of the inhibition zone were interpreted according to the Hangwei antibiotic susceptible zone interpretation chart and the M45 guideline for *Vibrio* spp. (not *V. cholerae*) of CLSI [103], except for oxytetracycline that was interpreted according to the M2-A8 guideline of CLSI [104].
