

Table S1. Concentrations ($\mu\text{g}\cdot\text{g}^{-1}$ FW) of the major polar metabolites detected in leaves of C2-5-12 Pummelo (*Citrus maxima*), *C. latipes*, and three corresponding sexual hybrids after derivatization with TMS and using gas chromatography-mass spectrometry ($n=4$)^z.

^z Values represent means±SD (*n*=4). ^y Quantification of leaf metabolites was based on calibration curves obtained from standards of known concentration injected into the GC-MS (Perkin Elmer Elite-5ms, 30 m × 0.25 mm × 0.25 μm) under the same chromatographic conditions as the samples. ^x *p*-values are bolded if less than 0.05. Different letters indicate statistically significant differences among the studied varieties (*p* < 0.05), while cells without letters or with the same letter signify no significant differences among them using Tukey-Kramer honestly significant different test (Tukey HSD).^w Metabolites have been confirmed using authentic reference standard.
