**Figure S2:** Unsupervised analysis of ESI negative data of *M. balsamina*, *M. Charantia*, *M. foetida* and *M. Cardiospermoides*. A PCA scores plot of the Pareto-scaled dataset of the four species including the quality control samples. The generated model was a 6-component model with PC 1 and PC 2 explaining 64% of the variation (A). The PCA loadings plot showing metabolites (outside the square) that contributed to the intrinsic patterns observes in the data set indicated in the scores plot (B). The HCA dendrogram indicating the hierarchical structure of the dataset, highlighting some species-specific metabolite differences (B).

**Figure S3:** Molecular Network (A) of *M. balsaima*, *M. charantia*, *M. foetida* and *M. cardiospermoides* for data generated using a liquid chromatography-tandem mass spectrometry using electrospray ionisation in negative mode. (B) MolNetEnhancer output showing different super classes within the four species.

**Table S1:** Profiling of metabolites in *Momordica balsamina*, *Momordica cardiospermoidea*, *Momordica charantia* and *Momordica Foetida* reported to level 2 or 3 of the Metabolomics standards initiative [51]. These metabolites were annotated from ESI (-) and ESI (+) data of the methanol extracts of the four *Momordica* species. Distribution of metabolites across the species is indicated by ✓ (presence) and ✗ (absence).
