

scFASTCORMICS: A contextualization algorithm to reconstruct metabolic multi-cell population models from single-cell RNAseq data- Supplementary File

Maria Pires Pacheco, Jimmy Ji, Tessy Prohaska, María Moscardó García and Thomas Sauter

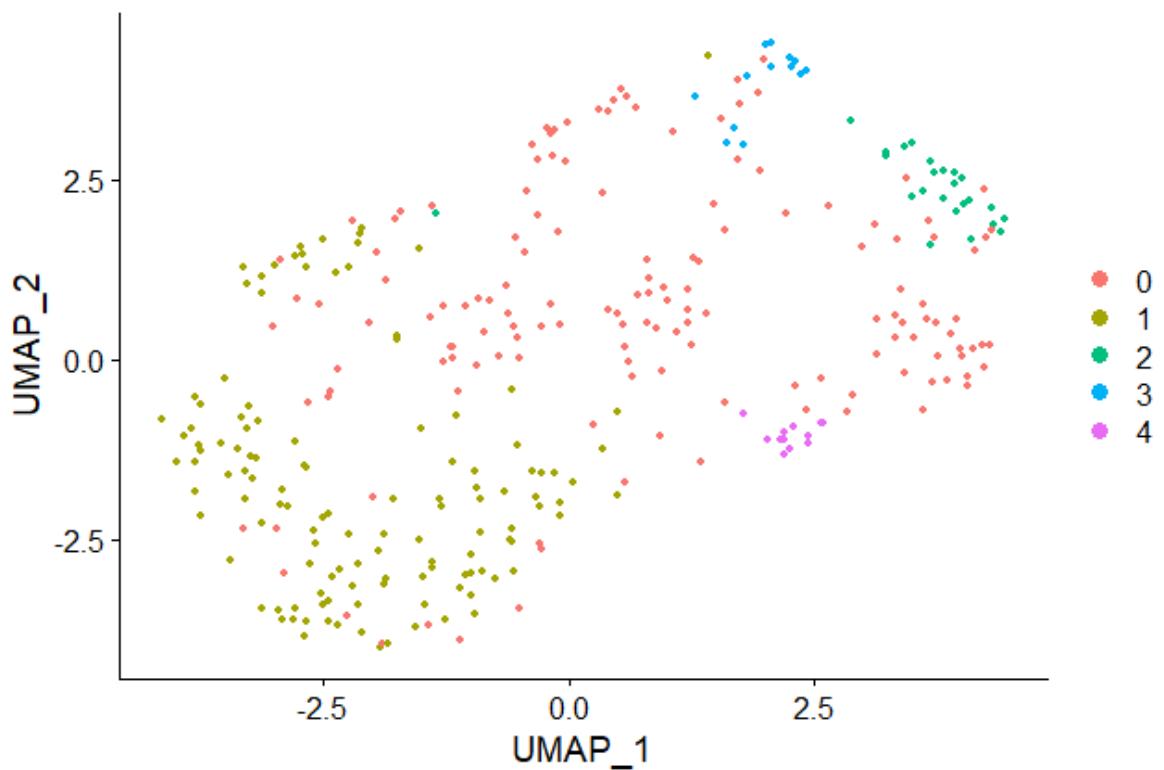

Figure S1: Quality Control: UMAP plot of the single-cell RNAseq data of dataset1 obtained after running the Seurat pipeline

Table S1: Datasets used for the parameter optimisation. The accession numbers of the single-cell RNAseq and the matching bulk RNAseq data as well as the tissue and cell type and the number of samples/cells are given for the 20 datasets.

Tissue/Cell type	Single-cell RNAseq data accession number	Number of cells	Bulk RNAseq accession number	Number of samples
Colorectal cancer (CRC)				
CRC tumour all cells	GSE81861	279	Lee <i>et al</i> (2020)	26
CRC normal mucosa	GSE81861	202	Healthy colon from GTEX	376
All cells				
Human islet single-cells (HISC)				
Pancreas donor 1		1551		
Pancreas donor 2		918		
Pancreas donor 3		1954		
Pancreas donor 4		1503	Pancreatic	
Pancreas donor 5		1052	islet cell	
Pancreas donor 6		404	from EBI	121
Pancreas donor 7		1860	Expression	
Pancreas donor 8		1557	Atlas	
Pancreas donor 9		2250		
Pancreas donor 10		2322		
Pancreas donor 11		2141		
Pancreas donor 12		2786		
Immune cells in pancreatic carcinoma (PACA)				
CD8 T-cells in PACA	GSE156728	5886	GSE156278	8
CD4 T-cells in PACA		3854		
Metastatic Merkel cell polyomavirus Merkel cell carcinoma (MCC)				
PBMC metastatic MCC	GSE117988	11327	PBMC from EBI Expression Atlas	7
Liver cancer cell				
Liver cancer set 1		5058	Liver cancer from TCGA (GSE62944)	377
Liver cancer set 2	GSE125449	4801		
Breast cancer cell				
Breast cancer set	GSE180286	3123	Breast cancer from TCGA (GSE62944)	1122

Table S2: The variance of the REI and coverage. The optimal REI and coverage, as well as the F score obtained with default and optimal REI and coverage were computed across 20 single-cell RNAseq datasets with different numbers of clusters and cell and tissue types to assess their variance. To evaluate the computational demands of the parameter optimization (PO), the size of the expanded and multi-cell population (MCP) models, the number of clusters and the running time with and without the PO is also given.

Tissue/Cell type	Number of clusters	REI (in %)	Coverage (in %)	Optimal F score	Default F score	Expanded model number of reactions	MCP model number of reactions	Running time (with PO) (hours))	Running time (without PO) (hours))
Colorectal cancer (CRC)									
CRC tumour all cells	5	20	2	0.167	0.217	48320	22961	6	0.35
