**Suppl. Figure 1.** L-Arg/ADMA ratios across healthy volunteers (negative controls, n=48), cryptogenic stroke patients (n=57) and acute myocardial infarction patients (AMI, positive controls, n=48). Box plots indicate the median, maximum and minimum value. P value across groups (double arrow line) was calculated by Kruskall-Wallis non parametric test of one-way ANOVA data. P value between groups (curly brackets) was calculated by Dunn's multiple correction.
* p ≤ 0.05; **** p ≤ 0.0001
