A Chain

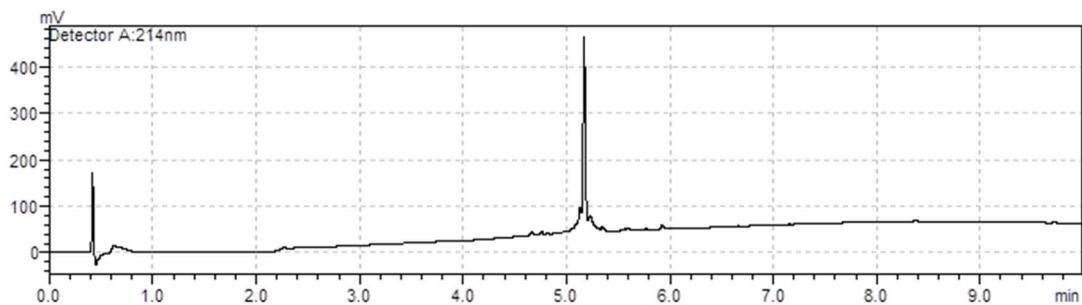

Figure S1. Alignment of full-length translated insulin-like peptide (ILP) sequences from the tentacle transcriptomes of three individuals of the sea anemone *Oulactis* sp. The gene is highly conserved across individuals of the species, particularly in the A chain. Sequences were deposited in the European Nucleotide Archive (EMBL-ENA) database under Project No. PRJEB34263 (Acc. No. LR700308-11). Sequence alignment was conducted in Clustal Omega (<https://www.ebi.ac.uk/Tools/msa/clustalo/>) [1-3]

Figure S2. Sequence alignment of top six species hits from NCBI Blastp of insulin-like_Oulsp_1_i1 (IIO1_i1) from *Oulactis* sp. E-value threshold 1e-10. Alignment shows high sequence similarity and conservation of the A chain, very low similarity in the B Chain with many of the sequences lacking obvious cleavage sites for the B and C chains. Sequence alignment was performed in Clustal Omega (<https://www.ebi.ac.uk/Tools/msa/clustalo/>) [1–3].

Figure S3. Sequence alignment of ILPs from five individuals of *Oulactis* sp. from two discrete morphological tissue regions: tentacles; frill and acrorhagi. The mesenterial filaments and gametic material bioinformatic analysis returned fragmented ILP sequences, which were excluded for subsequent analysis. Sequence alignment was conducted in Clustal Omega (<https://www.ebi.ac.uk/Tools/msa/clustalo/>) [1–3]. Sequences were deposited in European Bioinformatics Institute - European Nucleotide Archive (EMBL-ENA) database under Project No. PRJEB34263 (Acc. No. OU729069-77).
