

Figure S1. Flow chart for patient selection. For analysis purposes a total of 479 patients were screened from the local ECMO registry. 124 patients were excluded due to a VA-ECMO indication other than CPB weaning failure. These patients received VA-ECMO during the postoperative course because of hemodynamic decline, cardiopulmonary resuscitation, and/or respiratory failure after cardiac surgery within 30 days after surgery. 75 patients were excluded because of surgery - 61 patients who receiving a heart transplant and 14 patients with an unspecified intervention, ranging from a combined heart-lung transplantation, aortic annulus rupture after transcatheter aortic valve implantation, mediastinal cyst removal to ischemic ventricular septal defect. 16 patients who required VA-ECMO support for less than 24h and 15 patients who were in need of VA-ECMO re-implantation were excluded. A further 8 patients with missing baseline AP levels were excluded. One patient who participated at a study involving bovine alkaline phosphatase submission was excluded. One duplicate entry was excluded. Two-hundred-thirty-nine (239) patients entered the retrospective data analysis after reviewing the exclusion criteria.
