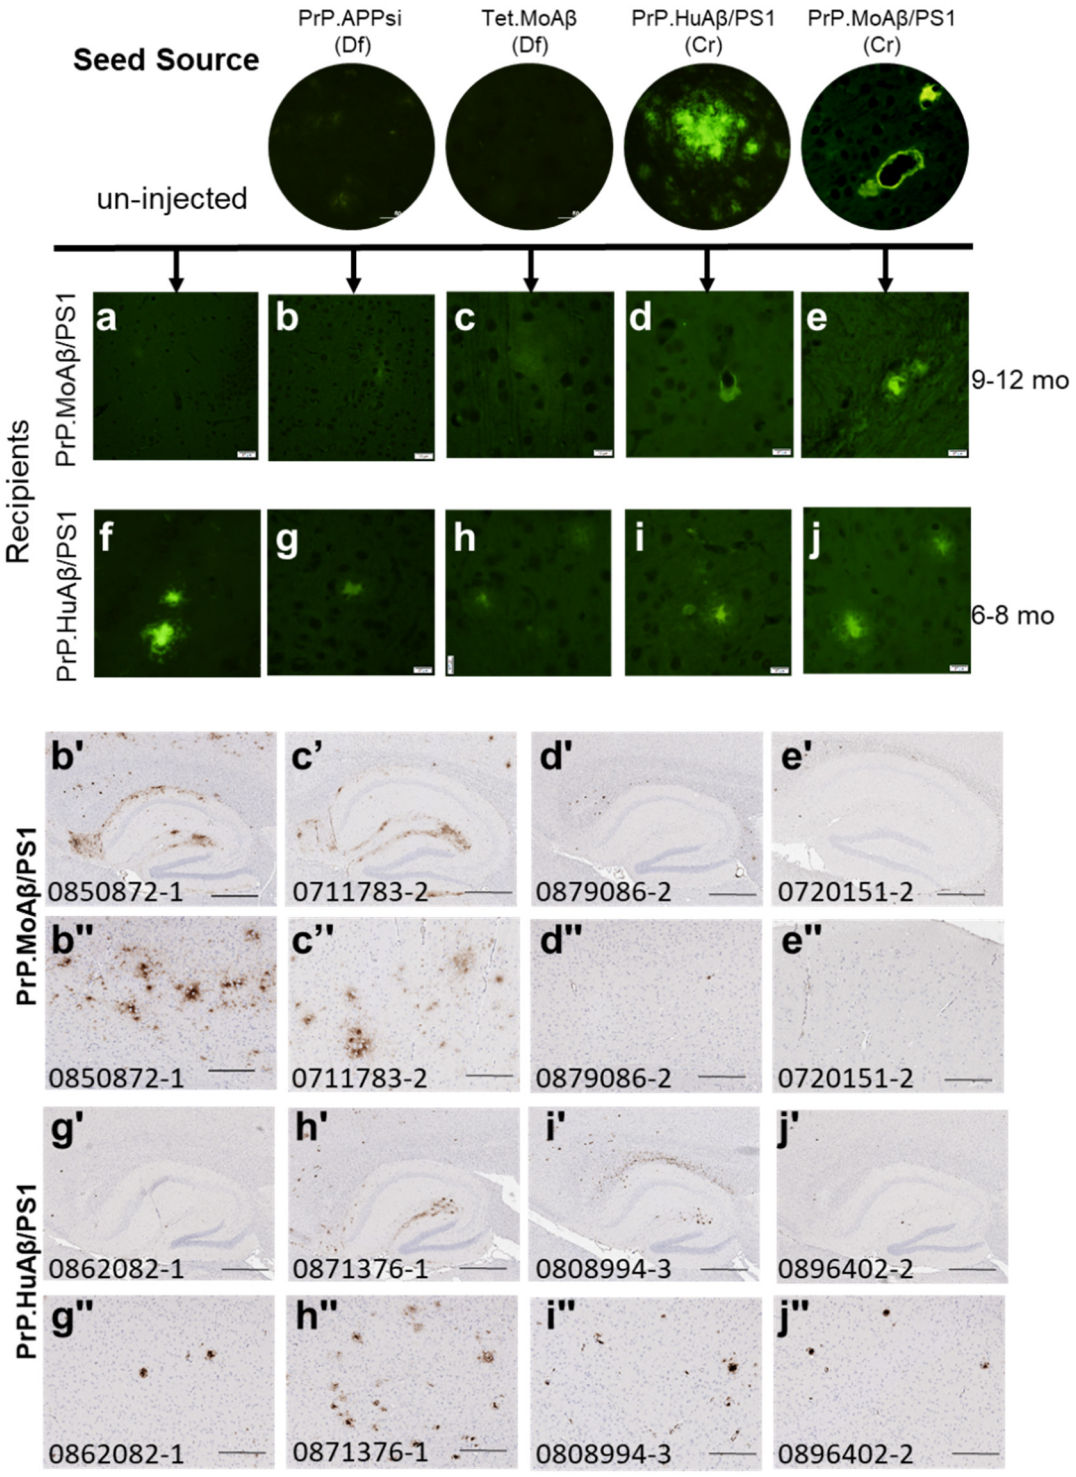

Figure S1. Representative images from tissue sections stained with Thio-S and Aβ antibodies for animals displayed in Figure 1. The layout of the figure is identical to that of Fig. 1 in the main text. The upper panels show high power images of Aβ deposit morphology from Thio-S silver staining in the brain of the seed source animal. The square images are from uninjected mice (a) and the brains of the recipients (b-j). All of these images are from cortex. b'-j'') Representative images or hippocampus and cortex of recipient mice. The labels and scale bars are the same as described in the legend of Figure 1 of the main text.

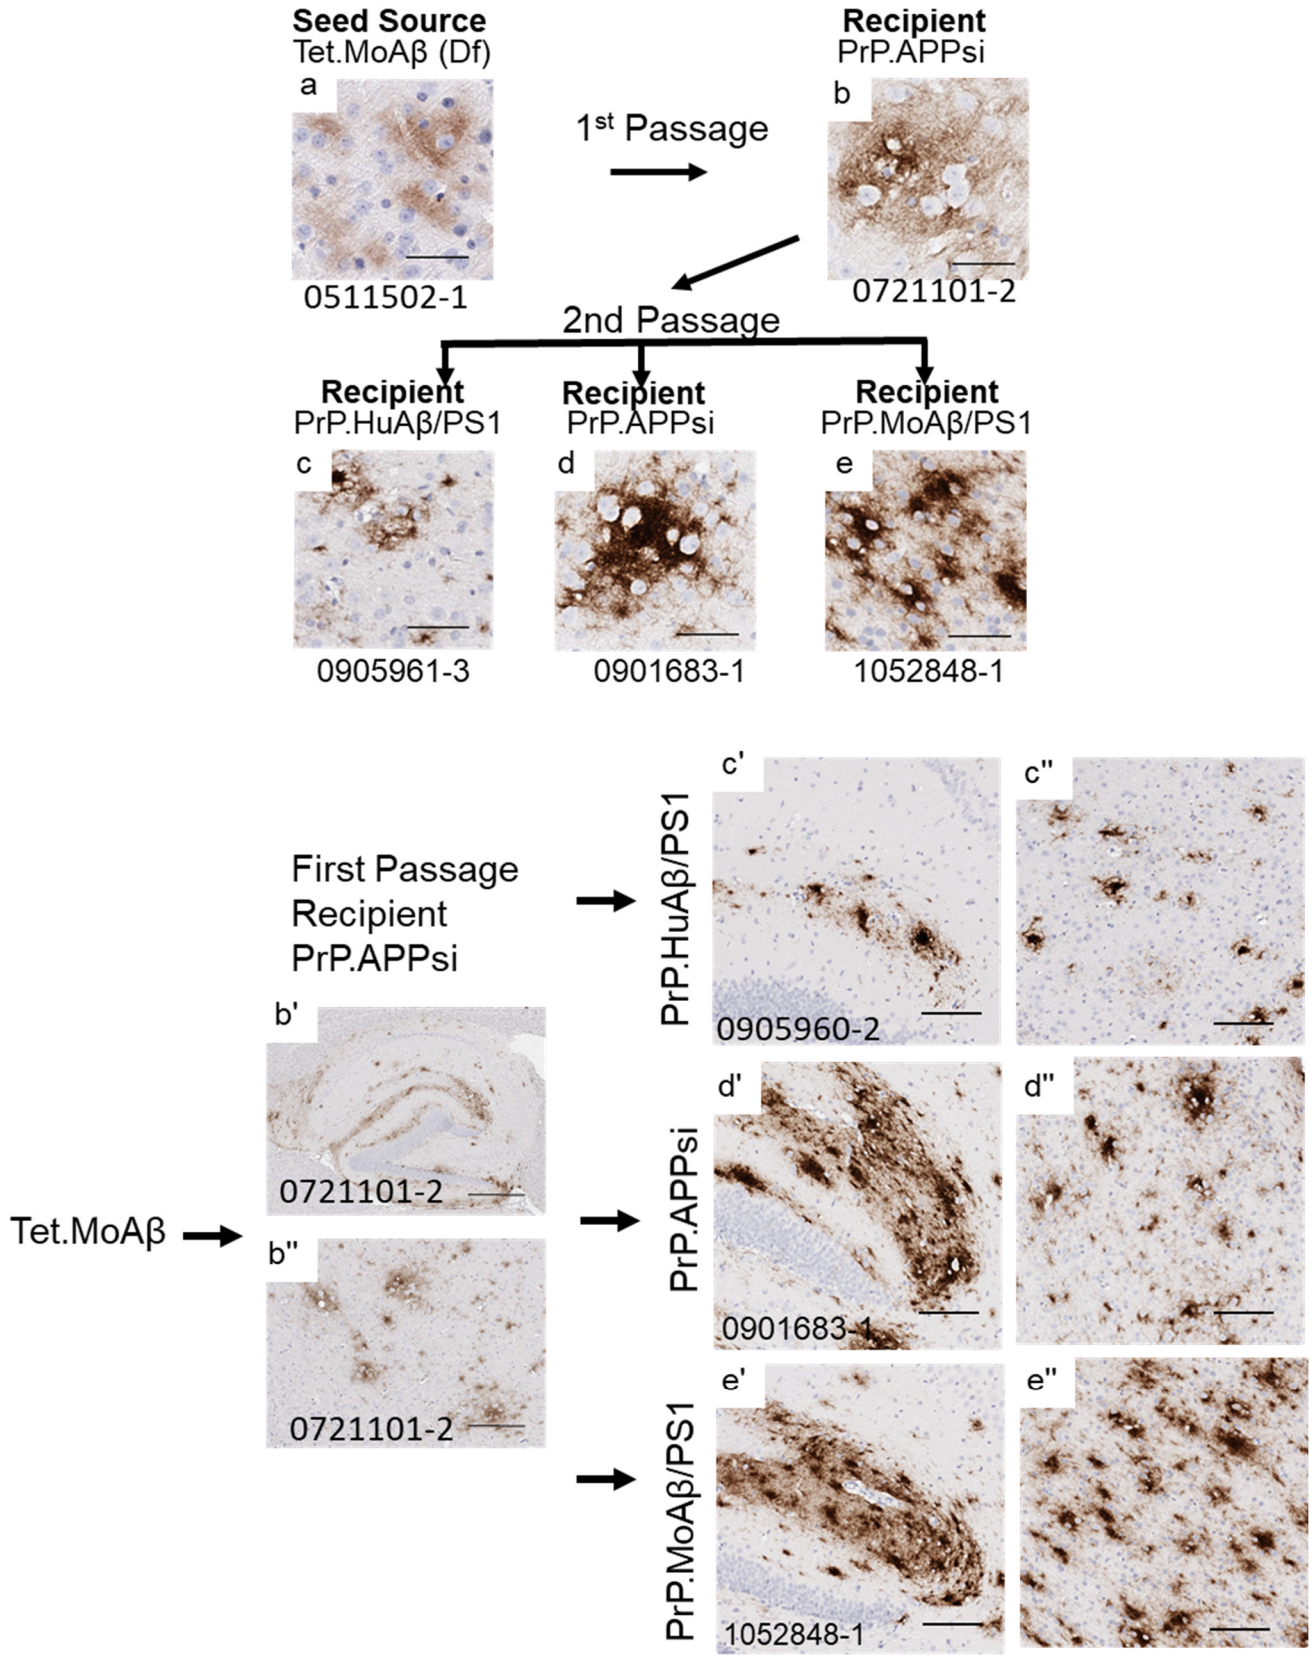

Figure S2. Representative images from tissue sections stained with Aβ antibodies for animals displayed in Figure 2. The layout of the figure, including labels and scale bars, is identical to the description of in the legend of Fig. 2 in the main text.

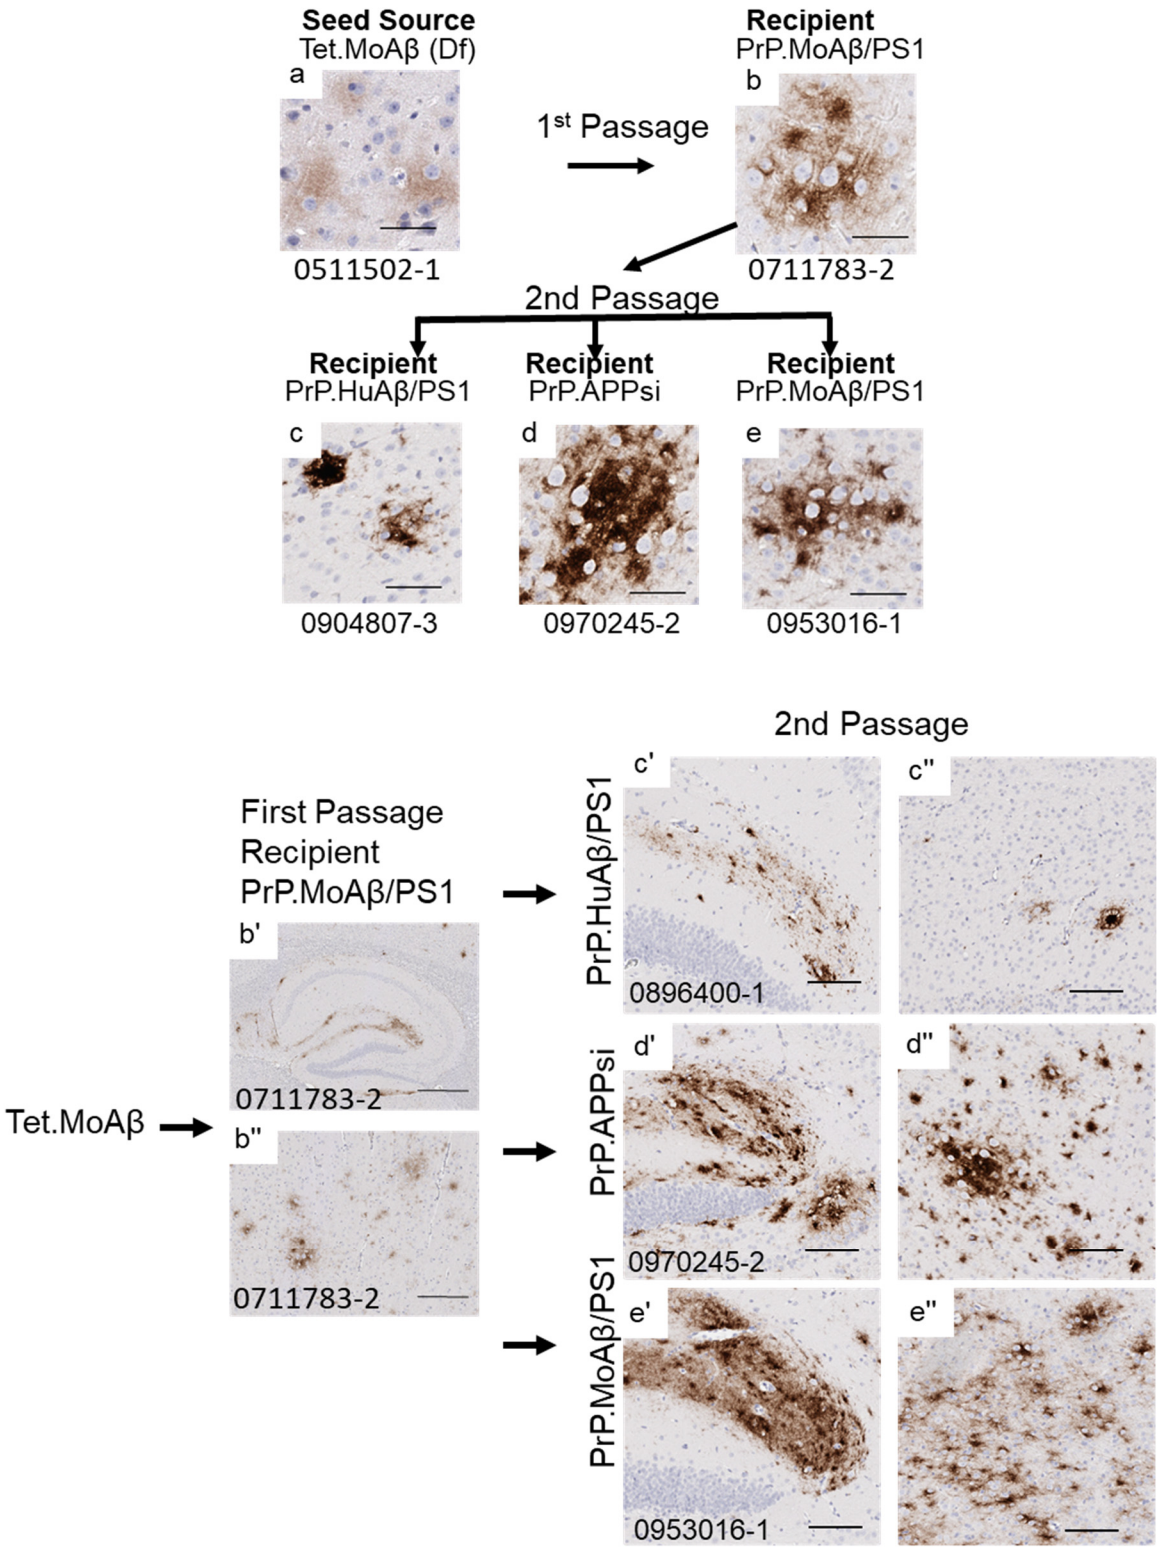

Figure S3. Representative images from tissue sections stained with Aβ antibodies for animals displayed in Figure 3. The layout of the figure, including labels and scale bars, is identical to the description of in the legend of Fig. 3 in the main text.

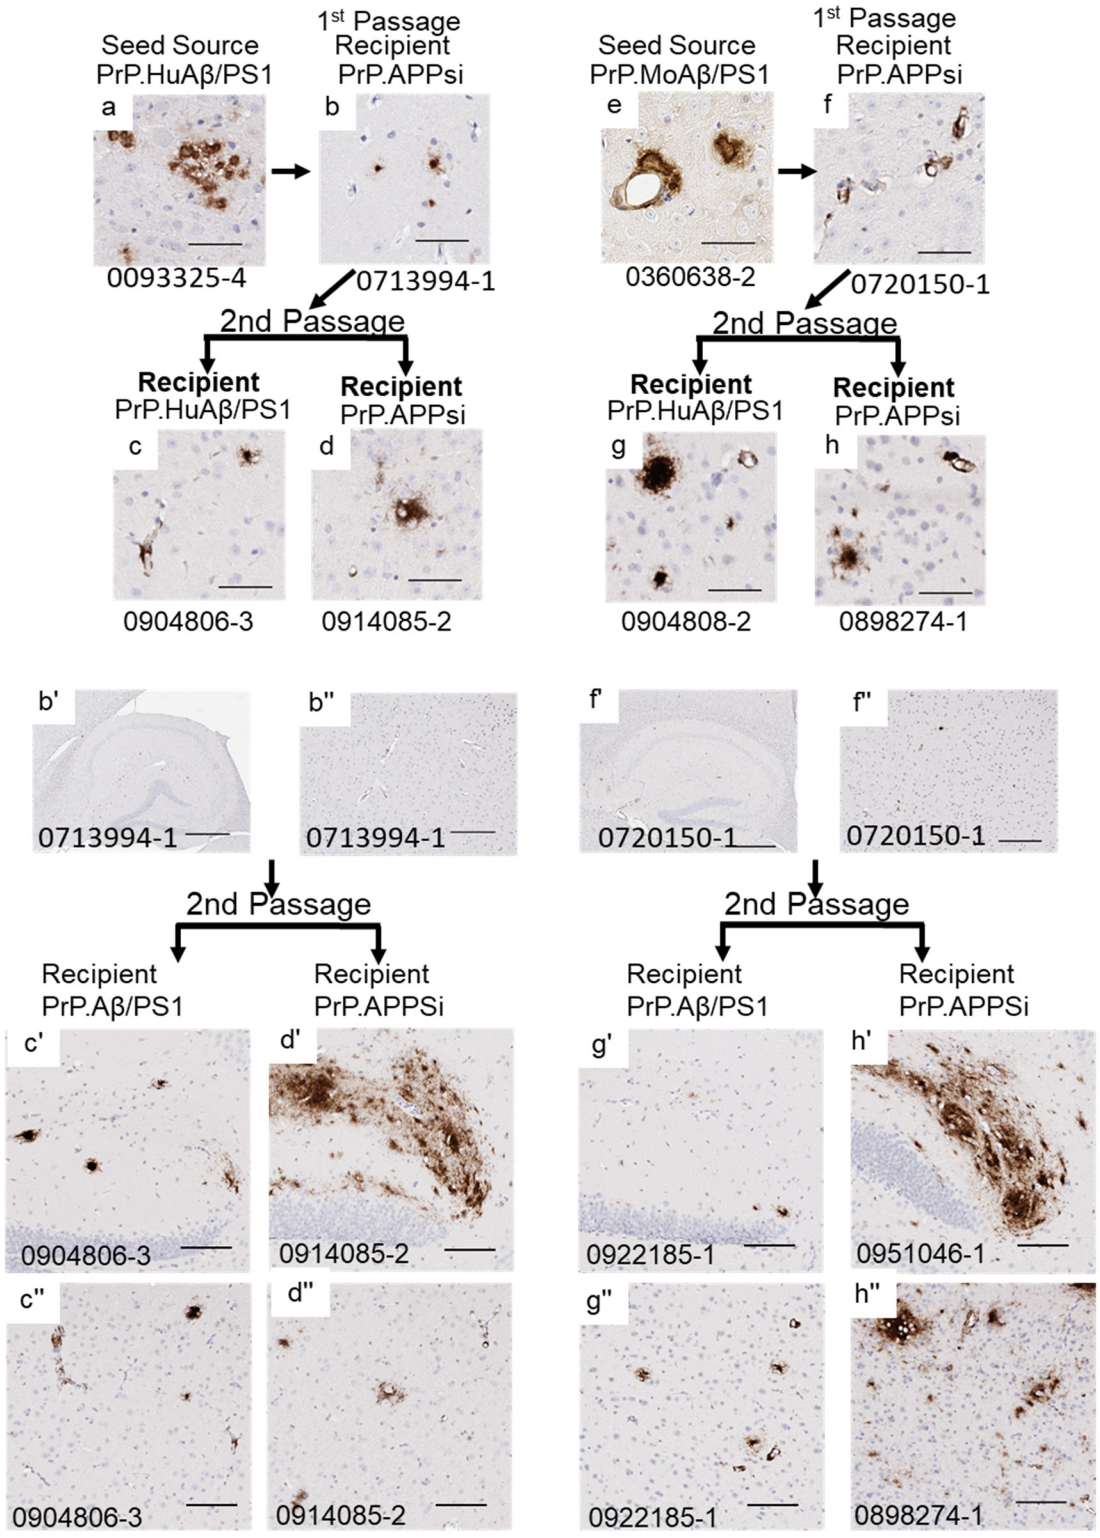

Figure S4. Representative images from tissue sections stained with Aβ antibodies for animals displayed in Figure 4. The layout of the figure, including labels and scale bars, is identical to the description of in the legend of Fig. 4 in the main text.
