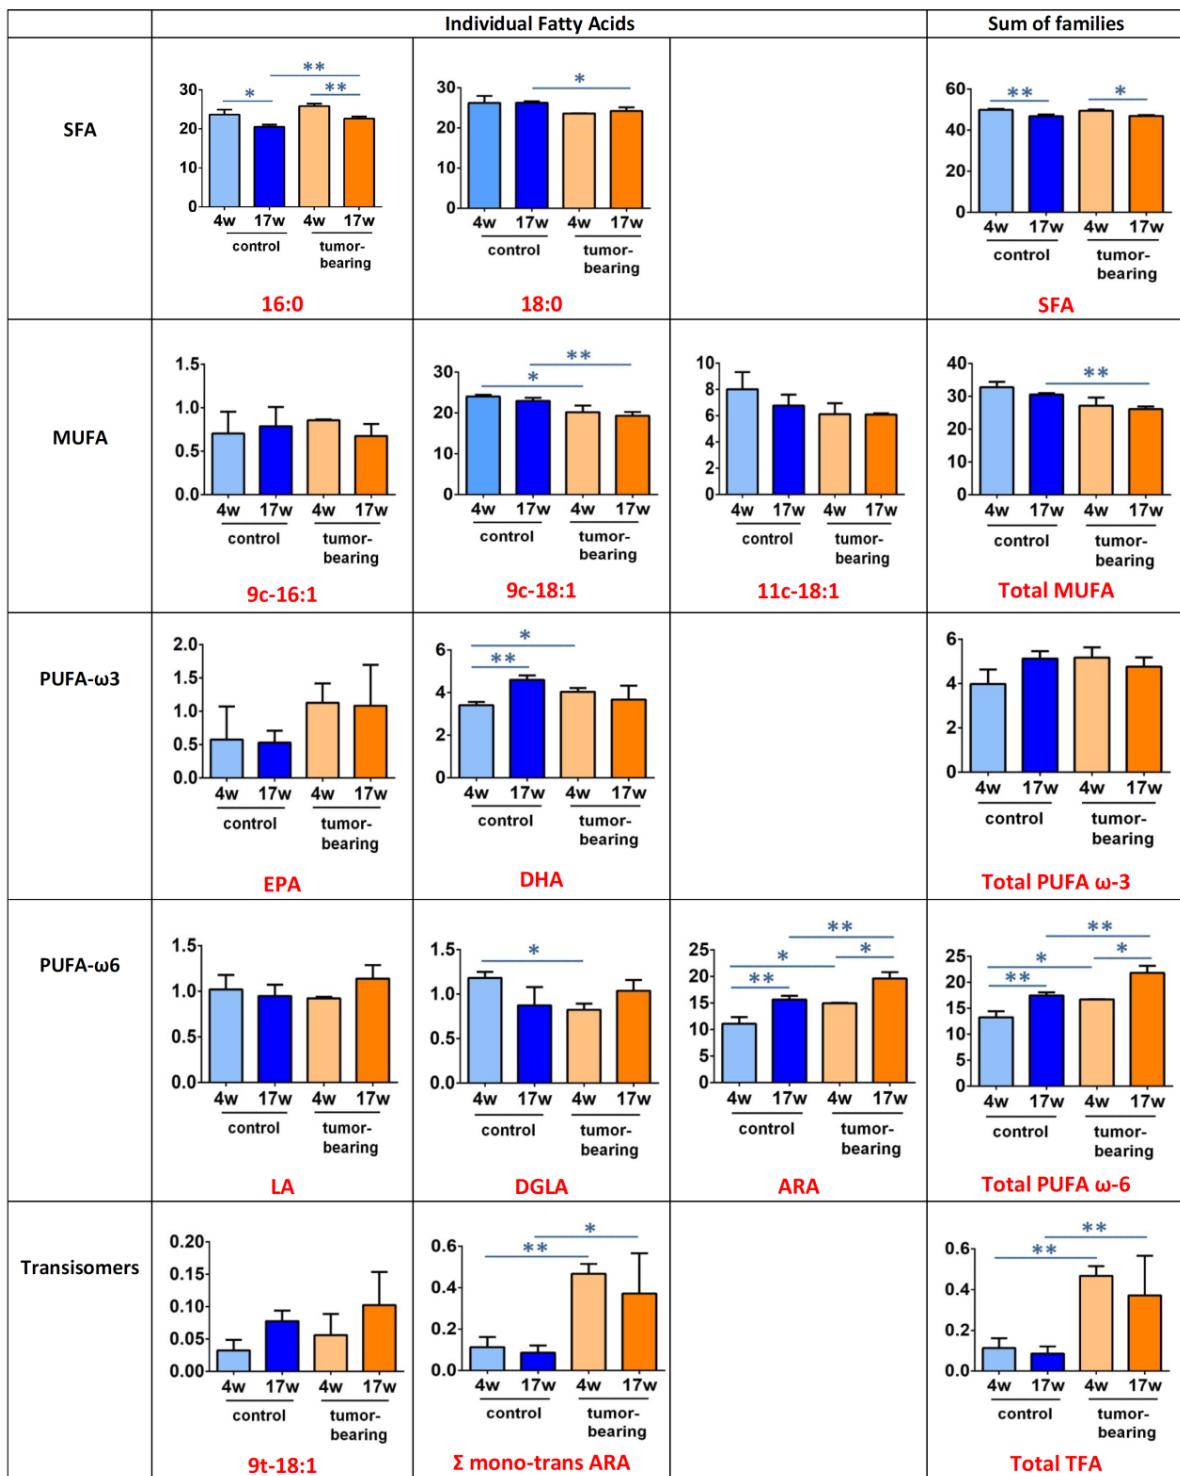

Figure S2. Percentage differences for each type of fatty acid in the brain tissue among control SCID mice and tumor-bearing SCID mice at 4 weeks and 17 weeks of age. The values are given as mean \pm SD (n=3). Each member of the fatty acid family is given in a row, the last column being the sum of the corresponding fatty acid family. * ($p < 0.05$), ** ($p < 0.01$); For specific values see Tables 2, 3, S7 and S8.

Table S9. Relative percentages (% rel) of fatty acid methyl esters (FAME), total FAME per family and lipid indexes obtained from brain tissue of normal mice at different age points (4 weeks and 17 weeks). ¹ *p* value represents the comparison between 4-weeks and 17-weeks normal mice after conducting unpaired t-test.²
