

Supplementary

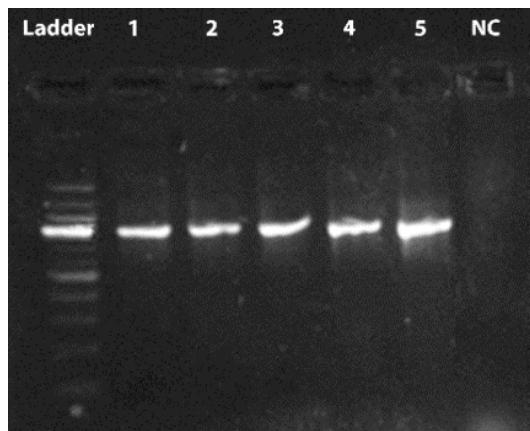

Figure 1. Electrophoresis gel: samples (1–5), negative control (NC). Bands are in accordance with the presence of the amplified DNA.

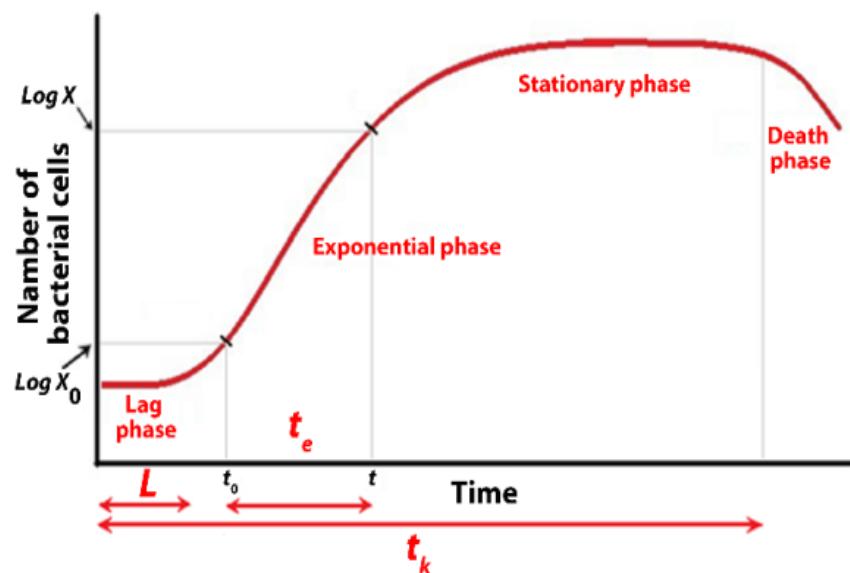

Figure 2. The typical bacterial growth curve: $\log X$, $\log X_0$, t and t_0 mark location of the values for the bacterial growth parameters; t_k – the time of the experiment, t_e – the time of exponential phase.

L – is the time of lag phase.

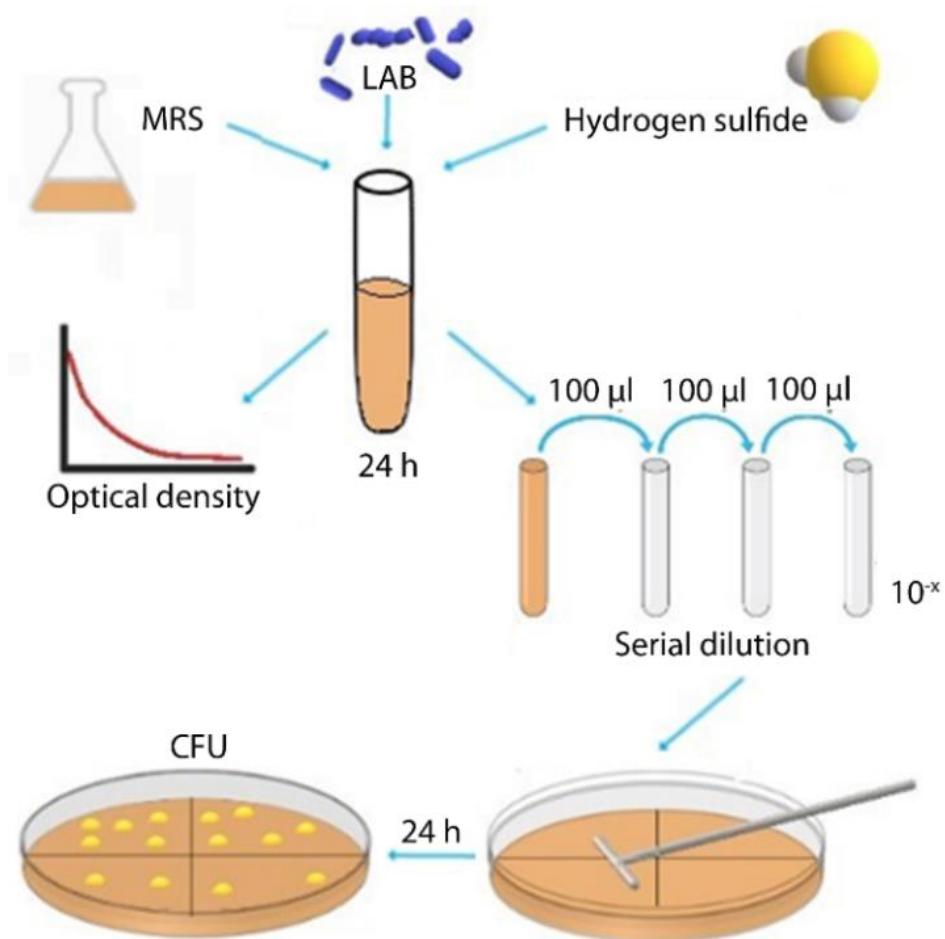

Figure 3. LAB cultivation (24 h) under the influence of H₂S. After 24 h the optical density (OD) was determined and, consequently, the reacting mixture was diluted and spread on the MRS agar.

Table 1. Optical density data measured by Bioscreen C spectrophotometer (M ± S_E, n = 5).
