

Supplementary information to Möhrle et al. "Suppression of an invasive native plant species by designed grassland communities"

Table S1: Species names and traits (and their respective sources) – cutting tolerance, plant height, seed mass, leaf size - and mean germination (see sources at Table S10) used in the experiment.

Table S2: Performance of grassland mixtures in suppressing the native invasive *Jacobaea aquatica* in relation to *J. aquatica* monoculture.

Table S3: Results of a linear mixed-effects model (lmer) for weekly biomass of *Jacobaea aquatica* with corrected outliers and rescaled data. Wald tests (type 3) with community type, traits constrained and diversified (and the respective interactions) as well as with phylogenetic diversity (PD) and CWM values of plant height, leaf area and seed mass type as predictors were applied to test for significant differences.

Table S4: Tukey test results for differences in weekly *Jacobaea aquatica* biomass between base communities. Comparisons of wet against mesic communities within the different experimental periods.

Table S5: Results of a HSD test following an ANOVA for the effects of the treatments within mesic communities on weekly biomass *Jacobaea aquatica*.

Table S6: Results of a HSD test following an ANOVA for the effects of the treatments within wet communities on weekly biomass *Jacobaea aquatica*.

Table S7: Twelve experimental plant community mixtures with constrained and diversified traits and corresponding seed mixture codes, as well as a reference grassland mixture produced by Bavarian State Research Centre for Agriculture (LfL) and a *Jacobaea aquatica* monoculture.

Table S8: Experimental settings of the experiment in a greenhouse of the Centre of Greenhouses and Laboratories Dürnast, Technical University of Munich, Germany

Table S9: Mean weekly biomass per tray (g 1.5 dm⁻²). Values represent average and std. error for the main community types.

Table S10: Literature sources and own germination tests data for the species used in the experiment.

Figure S1: Proportional native to invader biomass in the second (left) and third (right) experimental periods.

Table 1. Species names and traits (and their respective sources) – cutting tolerance, plant height, seed mass, leaf size, and mean germination (see sources at Table S10) used in the community experiment on suppression of an invasive native plant (*Jacobaea aquatica*).

Species	Cutting tolerance (BiolFlor)	Plant height (m) (LEDA)	Seed mass (mg) (LEDA)	Leaf size (mm ²) (LEDA)	Mean germination (%)
<i>Achillea millefolium</i>	7	0.40	0.13	411.0	93.2
<i>Anthoxanthum odoratum</i>	7	0.17	0.63	460.0	80.0
