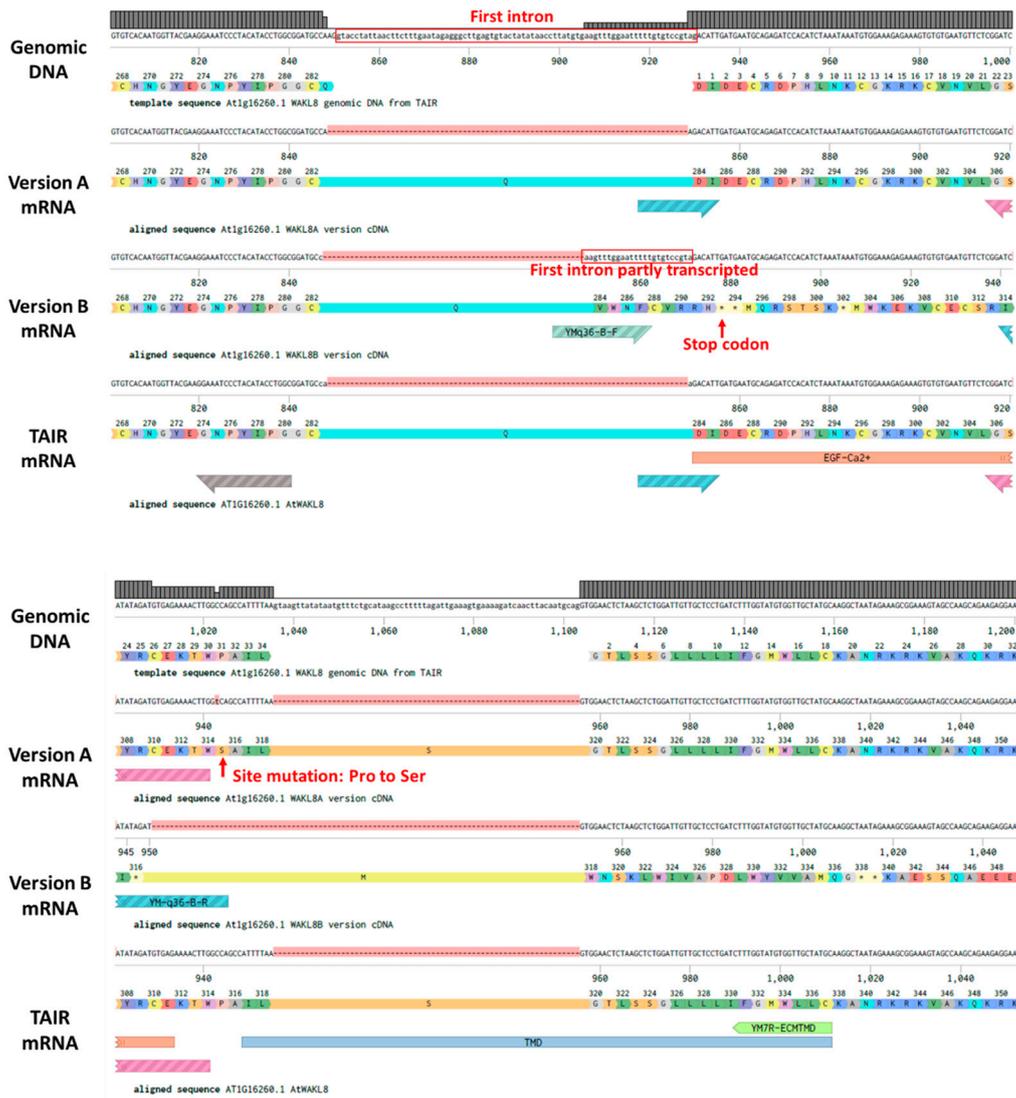

**Figure S1. Expression profiles of *WAKL8* during development.** Tissue level expression profile of *WAKL8* during Arabidopsis development visualized using eFP Browser [1,2]. The expression levels are represented as a colour gradient from yellow (lowest) to red (highest) and shows that *WAKL8* has slightly higher expression levels in stems and mature leaves than other tissues. In primary roots, *WAKL8* expression is highest in vascular cell types than other cells [1,3].

**Figure S2. Phloroglucinol-HCl staining of lignin in transverse sections 1 cm from the stem base of WT, *wak18-1* and *wak18-2* plants.** Fresh stems of WT (A-B), *wak18-1* (C-D) and *wak18-2* (E-F) plants at growth stage 6.5 were sectioned and stained with phloroglucinol-HCL. Scale bar = 20  $\mu$ m.

**Figure S3.** Mäule staining of lignin in transverse sections 1 cm from the stem base of WT, *wak18-1* and *wak18-2* plants. Fresh stems of WT (A-B), *wak18-1* (C-D) and *wak18-2* (E-F) plants at growth stage 6.5 were sectioned and stained with Mäule. Scale bar = 20  $\mu\text{m}$ .

**Figure S4. Sequencing of alternative spliced versions of *WAKL8* transcripts.** PCR fragments cloned from wild-type (WT) plant stem cDNA were sequenced and aligned with *WAKL8* genomic DNA and mRNA sequences downloaded from TAIR (<https://www.arabidopsis.org/>, accessed on 30 Jan 2018). *WAKL8A* version transcript had the same sequence as mRNA from TAIR but with a site mutation which caused an amino acid change from Pro to Ser before the predicted transmembrane domain (TMD). The *WAKL8B* version transcript had only a part of the first intron expressed, which caused a stop codon before the predicted EGF-Ca<sup>2+</sup> region.
