

Figure S1: Root dry weight of *S. lycopersicum* plants after low and high salt treatments.

S. lycopersicum seedlings were treated with low and high concentrations of NaCl (0, 25, and 175 mM). After 10 days of NaCl treatment, roots were dissected, dried, and the root weight was calculated as g/plant. Here, “a” represents statistically significant differences with $p < 0.05$. Error bars represent the standard error of the mean.
