

Biogeographic realms showed as the text color:

- Palaearctic
- Afrotropical
- Indomalayan
- Neotropical
- Antarctic

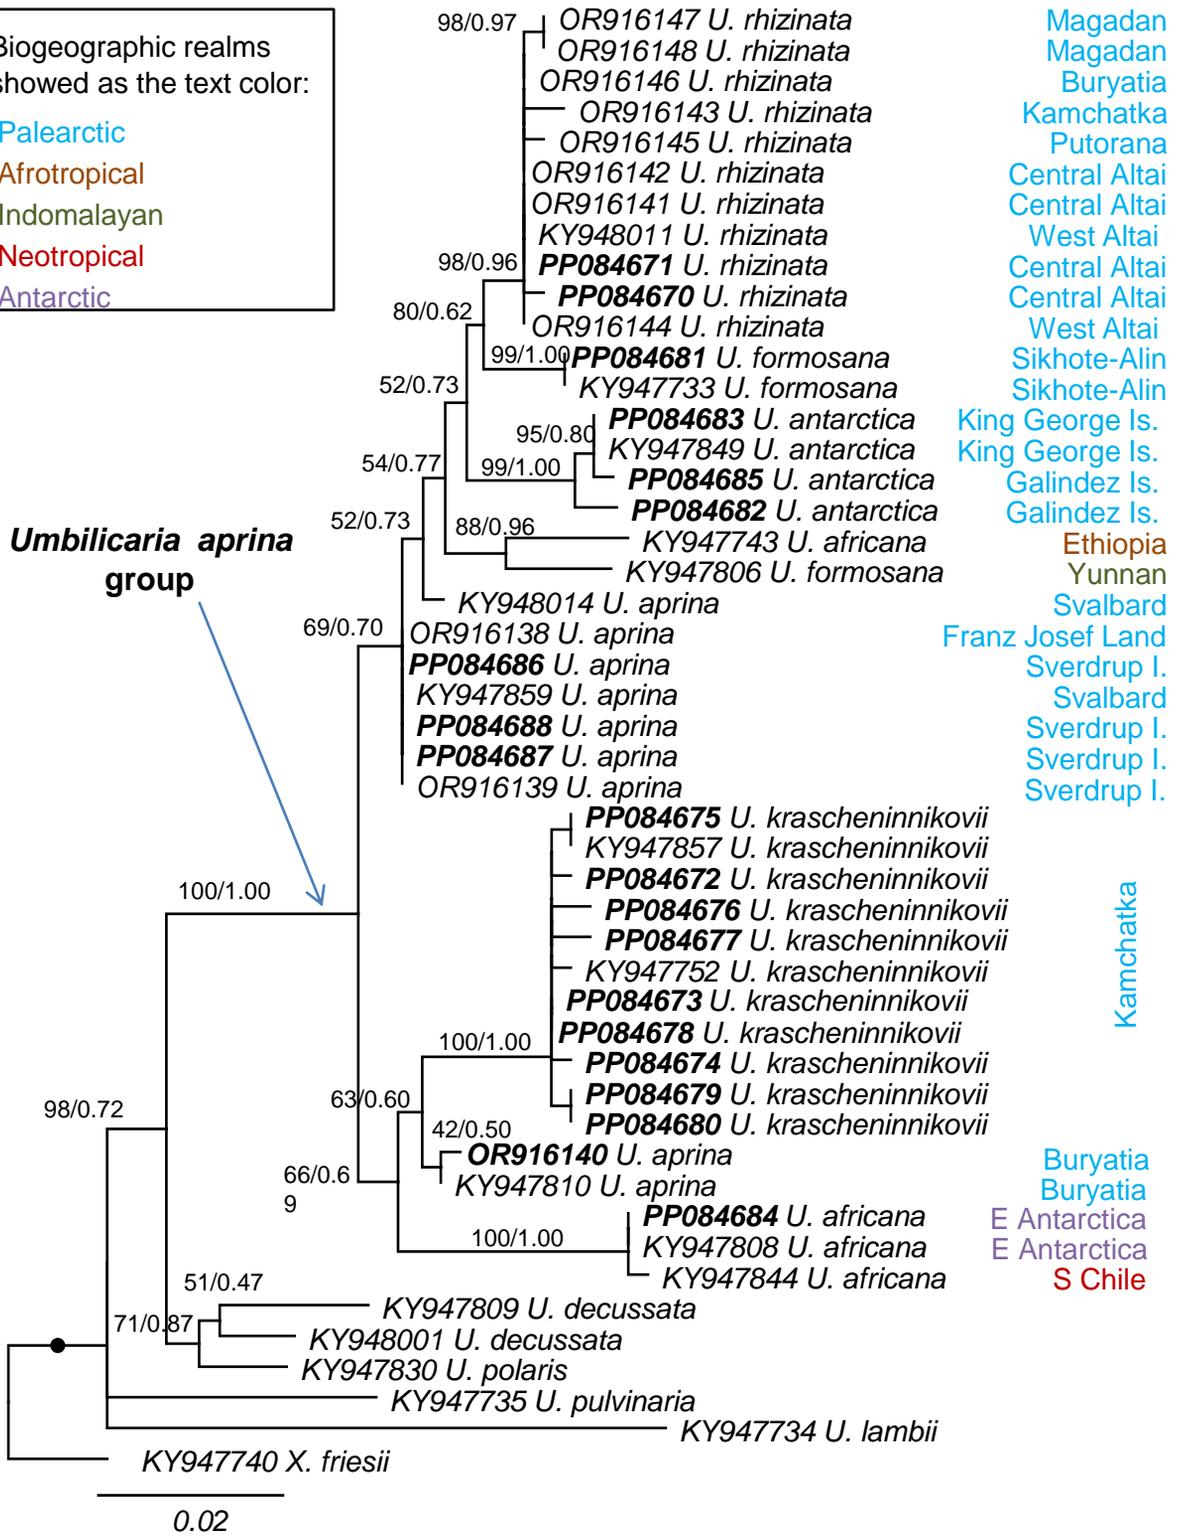

Figure S1. Phylogeny of *Umbilicaria aprina* group based on Maximum Likelihood analysis with IQ-TREE algorithm using the internal transcribed spacer region (ITS) sequences. The species names and GenBank accession numbers are indicated. The number in each node represents bootstrap support (BS) and posterior probability (PP). Branch lengths represent the estimated number of substitutions per site assuming the respective models of substitution. An exception is the branch with a black dot, which was shortened to reduce the overall figure size.

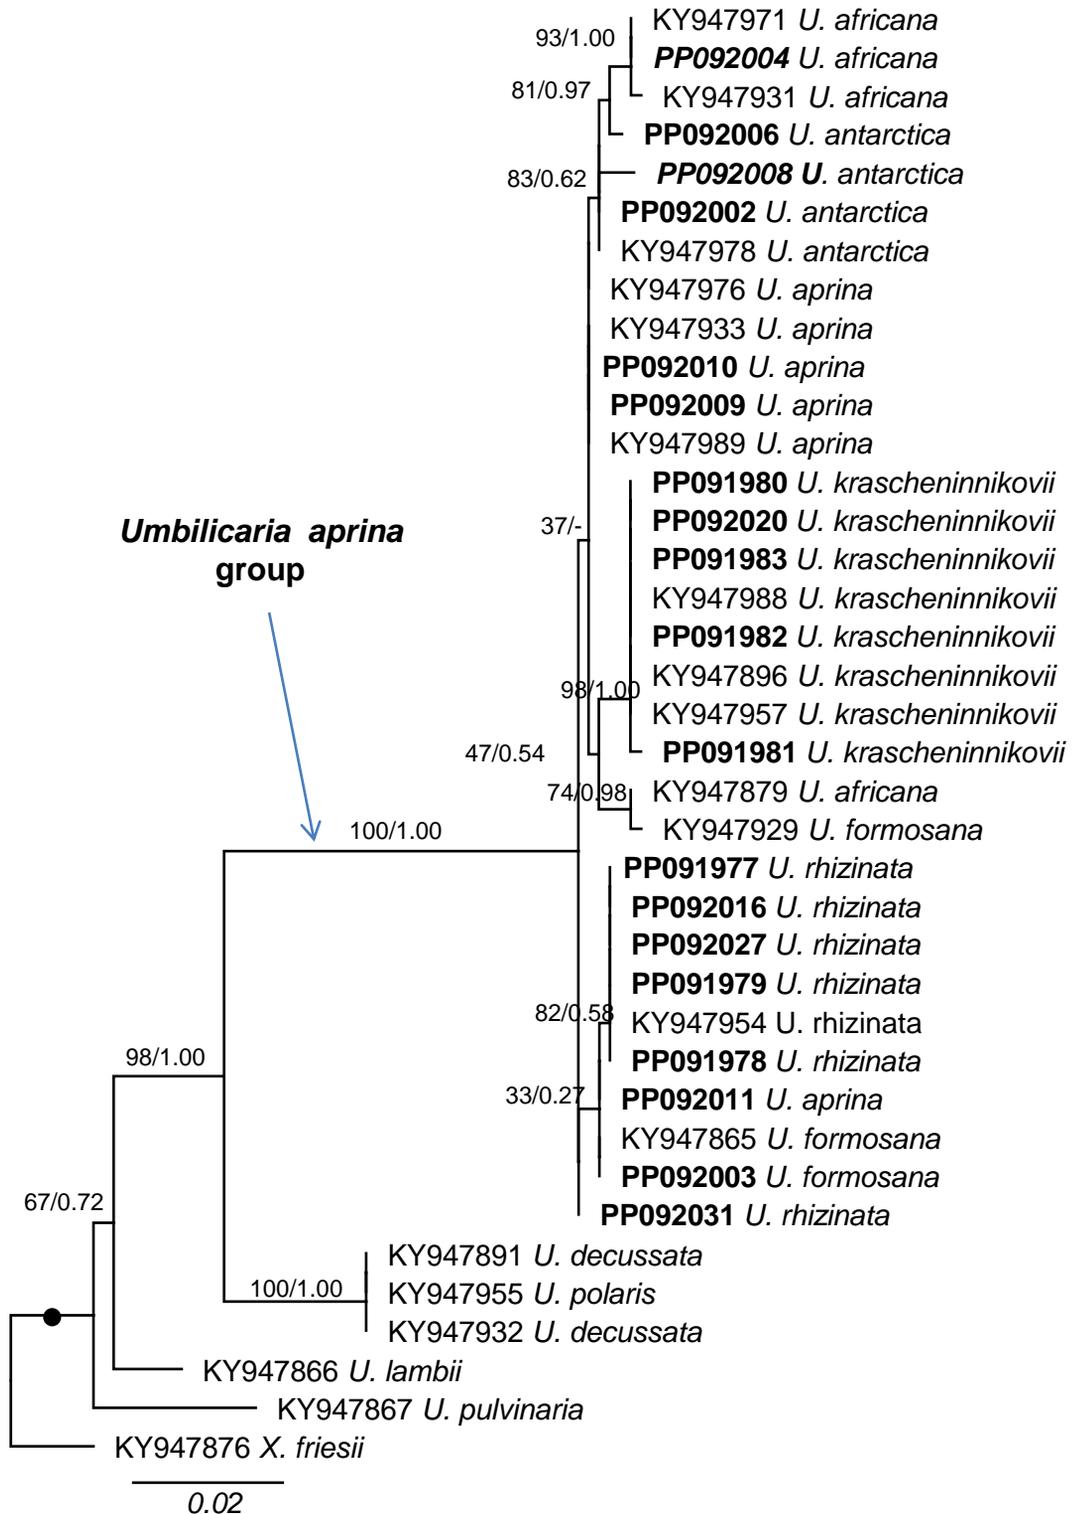

Figure S2. Phylogeny of *Umbilicaria aprina* group based on Maximum Likelihood analysis with IQ-TREE algorithm using the large subunit of the mitochondrial ribosomal DNA (mtLSU) sequences. The species names and GenBank accession numbers are indicated. The number in each node represents bootstrap support (BS) and posterior probability (PP). Branch lengths represent the estimated number of substitutions per site assuming the respective models of substitution. An exception is the branch with a black dot, which was shortened to reduce the overall figure size.

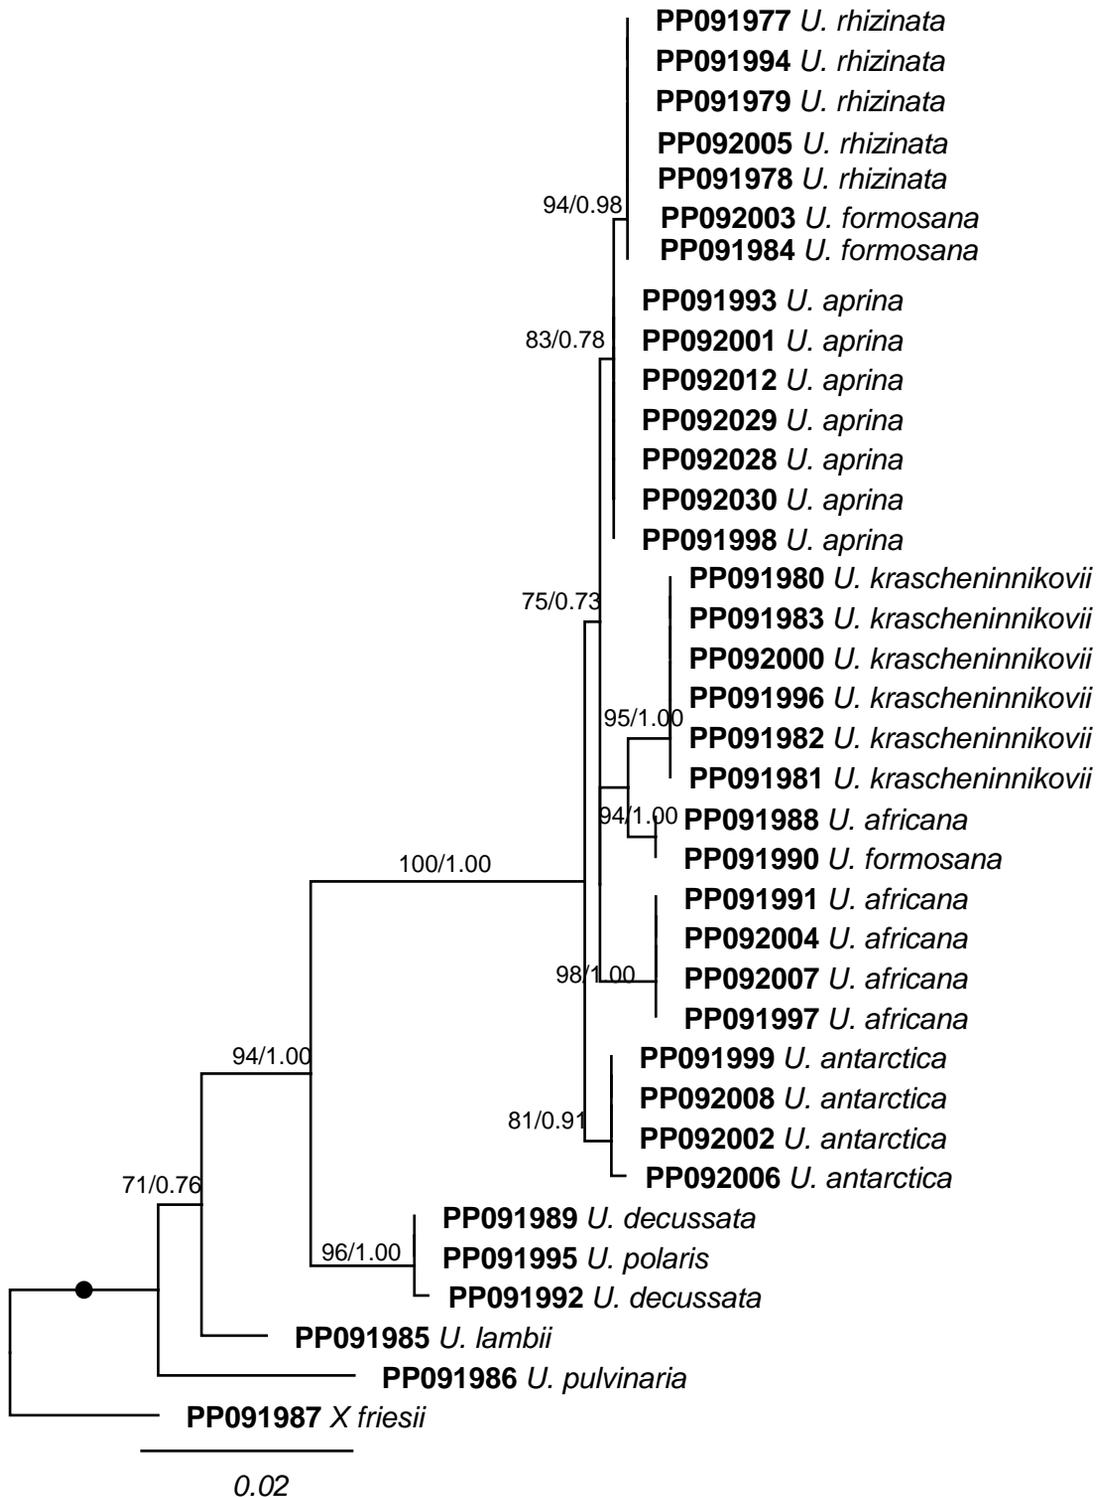

Figure S3. Phylogeny of *Umbilicaria aprina* group based on Maximum Likelihood analysis with IQ-TREE algorithm using the small subunit of the mitochondrial ribosomal DNA (mtSSU) sequences. The species names and GenBank accession numbers are indicated. The number in each node represents bootstrap support (BS) and posterior probability (PP). Branch lengths represent the estimated number of substitutions per site assuming the respective models of substitution. An exception is the branch with a black dot, which was shortened to reduce the overall figure size.

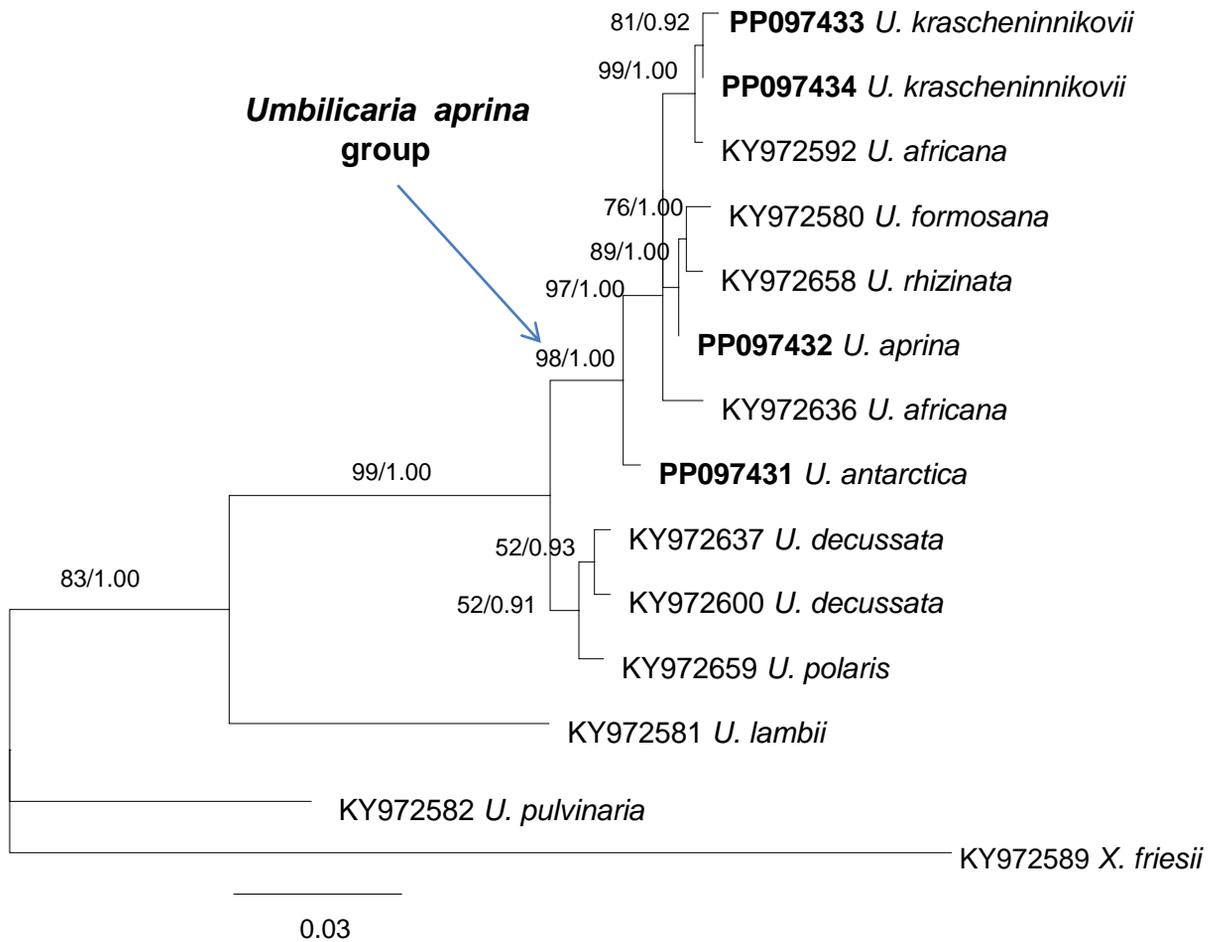

Figure S4. Phylogeny of *Umbilicaria aprina* group based on Maximum Likelihood analysis with IQ-TREE algorithm using the RNA polymerase II (RPB2) gene partial sequences. The species names and GenBank accession numbers are indicated. The number in each node represents bootstrap support (BS) and posterior probability (PP). Branch lengths represent the estimated number of substitutions per site assuming the respective models of substitution.

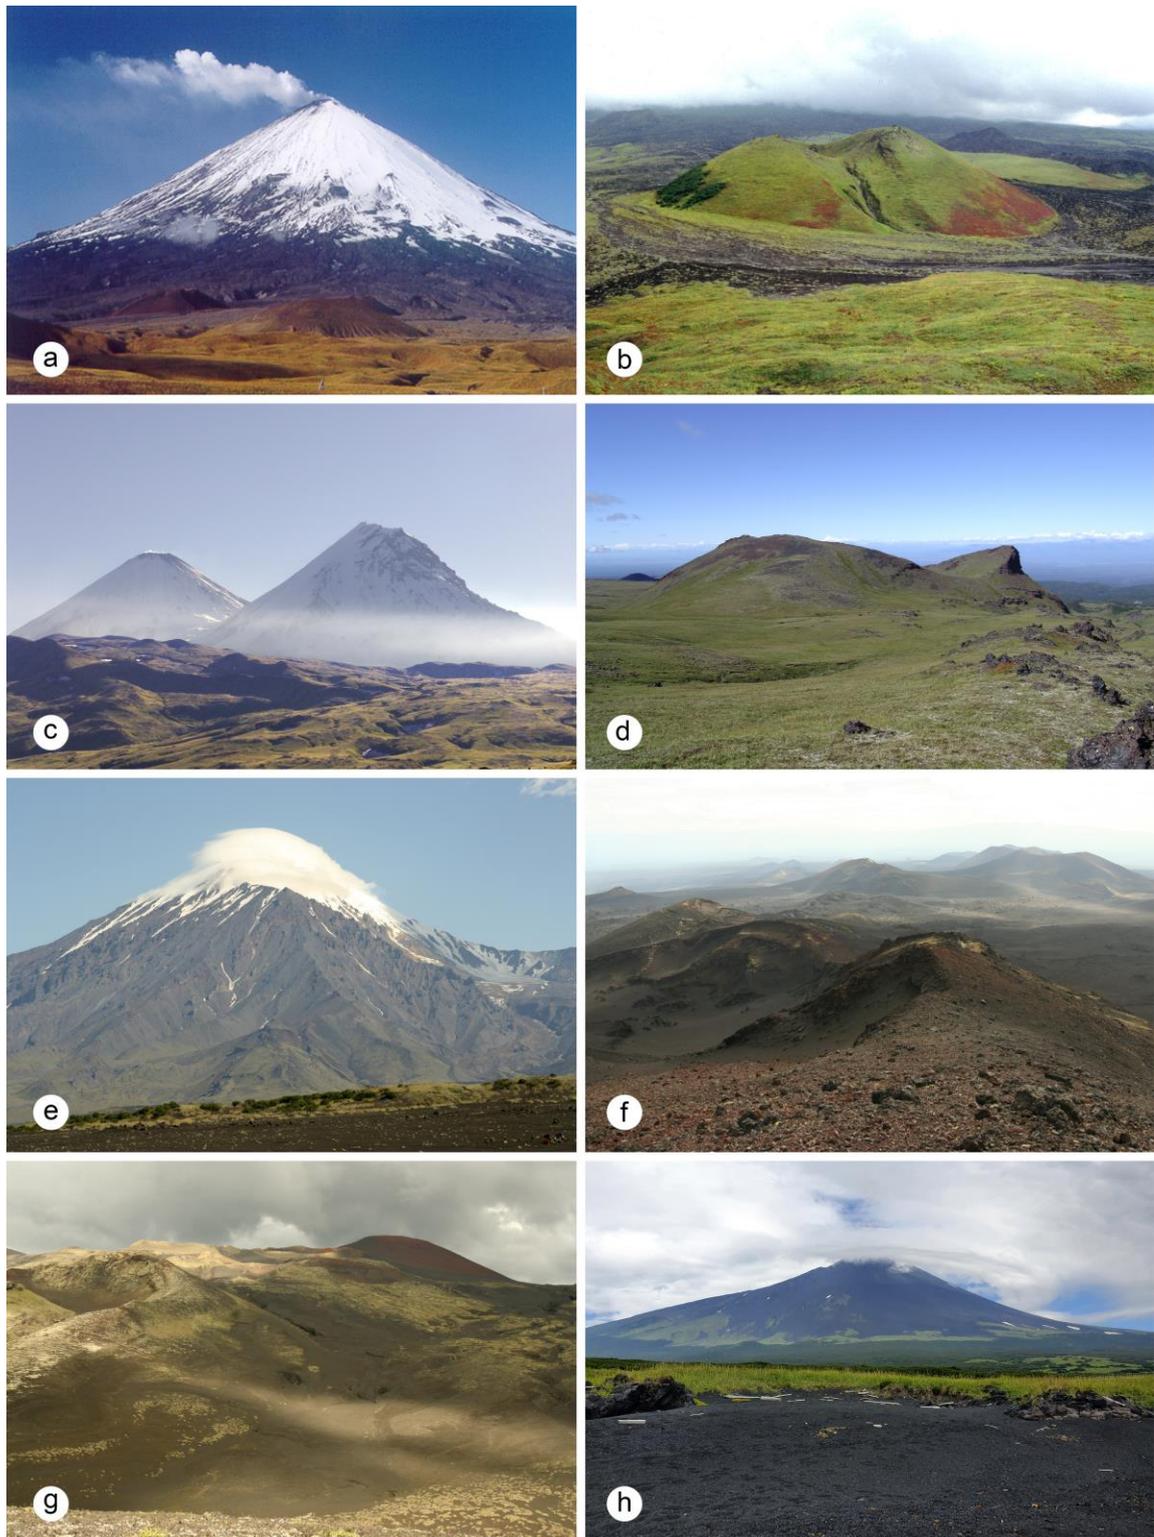

Figure S5. Typical habitats of *Umbilicaria krascheninnikovii* in Kamchatka Peninsula and Kurile Is.: (a) SE slope of Kluchevskaya Sopka Volcano; (b) Side (parasitic) cone and lava stream Apakhonchich on the SE slope of Kluchevskaya Sopka Volcano; (c) Ushkovsky Dale (foreground), volcanoes Kluchevskaya Sopka (left) and Kamen' (right); (d) Side cone on the SW slope of Ushkovsky Volcano; (e) N slope of Ostry Tolbachik Volcano; (f, g) Side cones on the SW slope of Tolbachik Volcano. *Umbilicaria krascheninnikovii* in such localities can be found on lava and volcanic bombs; (h) Alaid Volcano in the Atlasova Is.

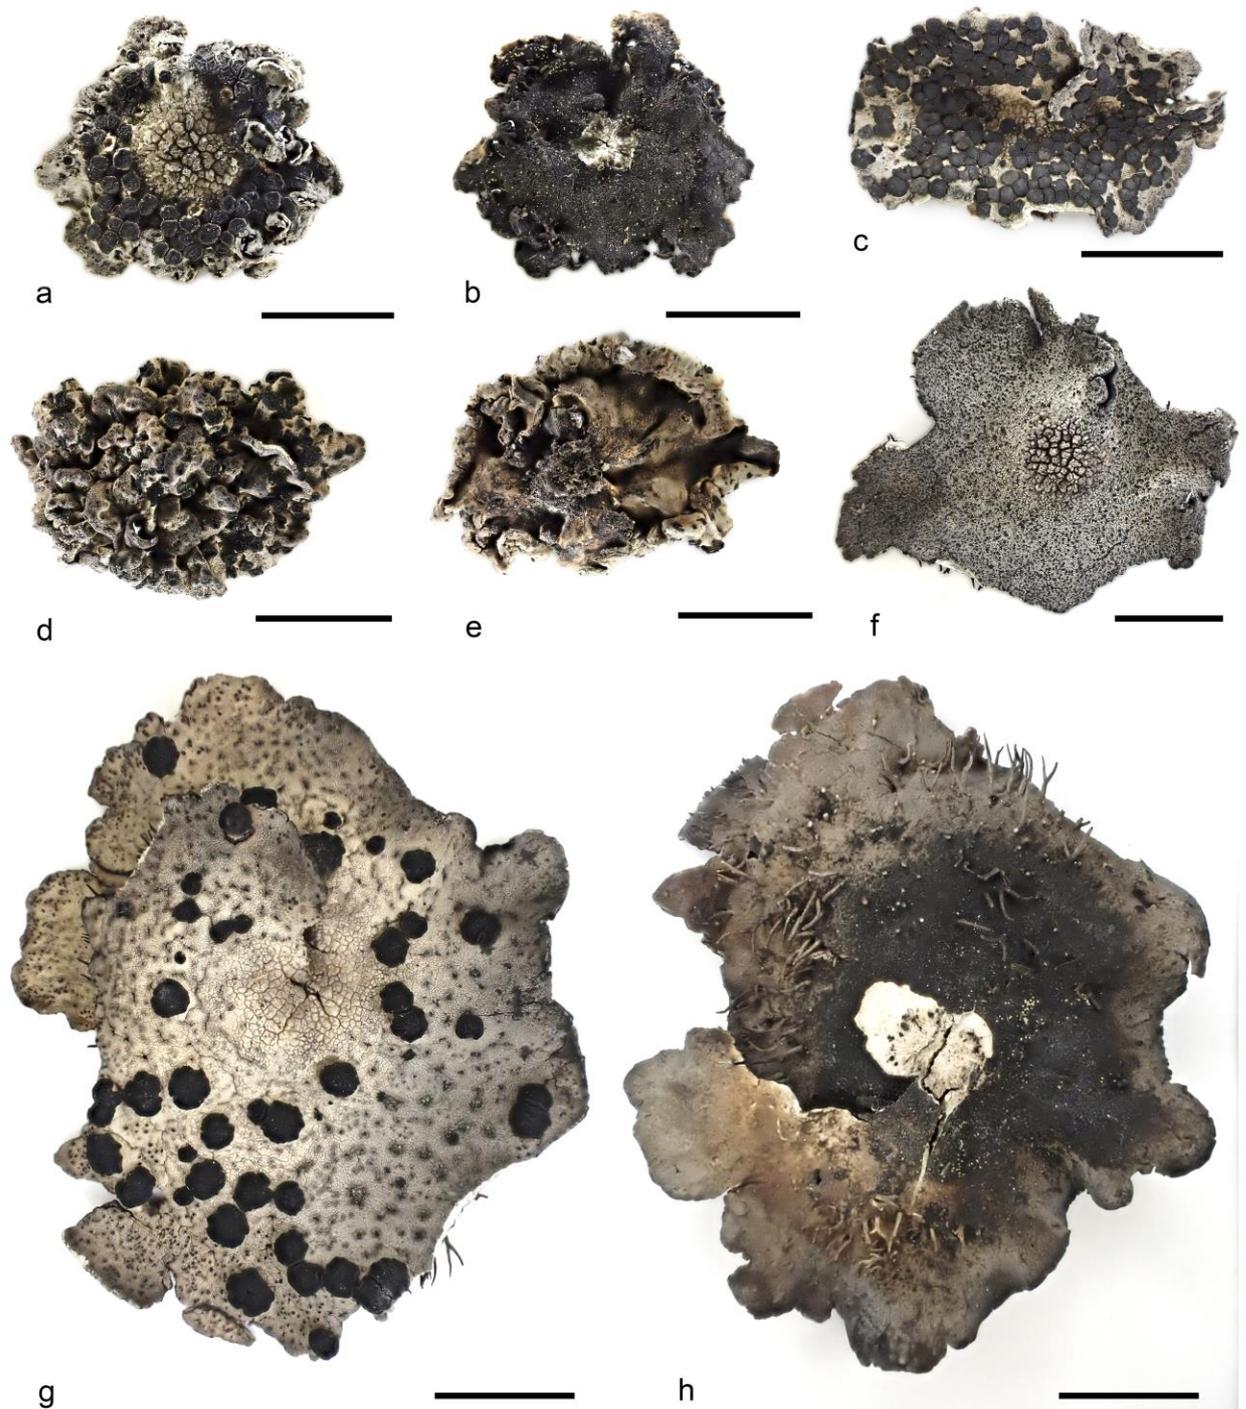

Figure S6. Variability of senescent specimens of *Umbilicaria krascheninnikovii*. A. Upper surface of small-sized senescent thallus with crowded apothecia; B. Entirely black lower surface; C. Upper surface of senescent thallus overgrown with apothecia; D. Irregularly wrinkled upper surface of small-sized senescent thallus with immature apothecia and pycnides; E. Light colored lower surface; F. Rather large senescent thallus without mature apothecia, but with numerous of black dots representing immature apothecia or/and pycnides; G. Uncommonly large senescent thallus with large lobate apothecia; H. Lower surface with scarce rhizinomorphs.

Table S1. Lichen samples used in this study, including voucher information and GenBank accession numbers.
