Changes in Photosystem II Complex and Physiological Activities in Pea and Maize Plants in Response to Salt Stress

Martin A. Stefanov, Georgi D. Rashkov, Preslava B. Borisova, and Emilia L. Apostolova

Table 1S. The influence of the different NaCl concentrations on the amplitudes and times of the fast (A_1 , t_1) and the slow (A_2 , t_2) component on the dark relaxation of chlorophyll fluorescence excited by a single saturating light in leaves of maize (*Zea mays* L. Method) and pea (*Pisum sativum* L. Ran 1). Mean values ($\pm SE$) were calculated from 8 independent measurements. Different letters indicate significant differences between the values in the same column at $p < 0.05$.

NaCl (mM)	t_1 (s)	t_2 (s)	A_1	A_2
<i>Zea mays</i> L.
