

Exhibition of local but not systemic induced phenolic defenses in grapevine (*Vitis vinifera* L.) affected by brown wood streaking, grapevine leaf stripe, and apoplexy (Esca complex)

Piebiep Goufo, Ana C. Marques, Isabel Cortez

Supplementary Table 1: Phenolic compounds identified in *Vitis vinifera* L. cv. Malvasia leaves from healthy, brown wood streaking, grapevine leaf stripe and apoplexy-infected vines, and listed in decreasing order based on their average contents (dry weight basis), and the correlation between the content of each phenolic compound and level of esca leaf symptom severity. The disease severity is rated using a semi-quantitative scale from 1 to 4 where: 1= Grapevine Leaf Stripe Disease stage 1; 2 = Grapevine Leaf Stripe Disease stage 2; 3 = Grapevine Leaf Stripe Disease stage 3, and 4 = Apoplexy. Significant *r* values are highlighted in red ($P \leq 0.01$), yellow ($P \leq 0.05$), and gray ($P \leq 0.10$).

Peak number	Retention time (min)	UV spectrum (λ_{max})	Reference standard peak area	Response factor	Expression (mg.kg ⁻¹ equivalent of compound)	Phenolic compound	Mode of identification	Phenolic group	Average content (mg.kg ⁻¹)	<i>r</i> value (Pearson)	<i>P</i> value

Supplementary Table 2: Effect of brown wood streaking, grapevine leaf stripe and apoplexy (Esca complex) on minor phenolic compounds (average content < 1.00 mg.kg⁻¹, dry weight basis) in *Vitis vinifera* L. cv. Malvasia leaves. Data are presented as mean ± SD of four replicates. Row values followed by different letters are statistically different at $P \leq 0.05$ (ANOVA, Tukey's test). GLSD = Grapevine Leaf Stripe Disease.

Phenolic compound	Expression (mg.kg ⁻¹ equivalent of compound)	Control leaves (Apparently healthy)	Asymptomatic 1 (Brown wood streaking)	Asymptomatic 2 (GLSD-foliar symptomatic)	Asymptomatic 3 (GLSD-berry symptomatic)	GLSD stage 1 (Chlorotic leaves)	GLSD stage 2 (Spotting/scorching leaves)	GLSD stage 3 (Tiger striped leaves)	Apoplexy (Apoplectic Leaves)

Supplementary Table 3: Fatty acids identified in *Vitis vinifera* l. cv. Malvasia leaves from healthy, brown wood streaking, grapevine leaf stripe and apoplexy-infected vines, and listed in decreasing order based on their average contents (dry weight basis), and the correlation between the content of each fatty acid and level of esca leaf symptom severity. The disease severity is rated using a semi-quantitative scale from 1 to 4 where: 1 = Grapevine Leaf Stripe Disease stage 1; 2 = Grapevine Leaf Stripe Disease stage 2; 3 = Grapevine Leaf Stripe Disease stage 3, and 4 = Apoplexy. Significant *r* values are highlighted in red ($P \leq 0.01$), yellow ($P \leq 0.05$), and gray ($P \leq 0.10$).

Supplementary Table 4. Effect of brown wood streaking, grapevine leaf stripe and apoplexy (Esca complex) on the levels (% dry weight basis) of 24 fatty acids in *Vitis vinifera* L. cv. Malvasia leaves. Data are presented as mean $\pm$ SD of four replicates. Row values followed by different letters are statistically different at $P \leq 0.05$ (ANOVA, Tukey's test). GLSD = Grapevine Leaf Stripe Disease.

Common name	Lipid number	Control leaves (Apparently healthy)	Asymptomatic 1 (Brown wood streaking)	Asymptomatic 2 (GLSD-foliar symptomatic)	Asymptomatic 3 (GLSD-berry symptomatic)	GLSD stage 1 (Chlorotic leaves)	GLSD stage 2 (Spotting/scorching leaves)	GLSD stage 3 (Tiger striped leaves)	Apoplexy (Apoplectic Leaves)

Supplementary Figure 1. Principal component analysis (PCA) score and loading plots of phenolic compounds in leaves of vines infected by brown wood streaking, grapevine leaf stripe and apoplexy (Esca complex). Highlighted in red are 15 compounds whose levels progressively increased with increasing foliar symptom severity. C75 = quercetin, C14 = cinnamic acid derivative 4, C56 = unknown compound 2, C1 = quinic acid, C76 = cinnamic acid, C79 = hesperetin, C30 = syringic acid, C19 = cinnamic acid derivative 6, C9 = benzoic acid derivative 1, C82 = isorhamnetin-3-O- galactoside, C83 = isorhamnetin-3-O- glucoside, C77 = kaempferol, C81 = kaempferol-3-O-rhamnoside, C68 = kaempferol-3-O-glucuronide, C65 = kaempferol-3-O-galactoside. PC1 and PC2 eigenvalues for phenolic compounds discriminated by PCA are also shown in a table, and in colour in the table are compounds contributing the most to the separation of leaf groups. Data were square-root transformed prior to PCA, which was performed on unit variance auto-scale using an Excel statistical tool (http://prime.psc.riken.jp/Metabolomics_Software/StatisticalAnalysisOnMicrosoftExcel/).
