Figure S1. Response to water-deficit stress (WDS) in different amaranth species. Images of representative (A) *Amaranthus hypochondriacus* cv. Gabriela and (B) *A. cruentus* cv. Amaranteca plants used in the first selection experiment under optimal conditions [O], and 5 [M] and 10 [S] days after watering was withheld, and in [R], one day after watering was restored, after S. Panels (C) and (D) show *A. caudatus* and *A. hybridus* plants during one of the two formal WDS experiments performed under moderate WDS. Wilting is evident in both groups of plants even before the final 30% field capacity was reached. In panel (E), an image of the extreme desiccation suffered by *A. hybridus* plants during the preliminary 5- and 10-day WDS experiments. Also shown, is this species' ability to partially recover several days after watering was restored.

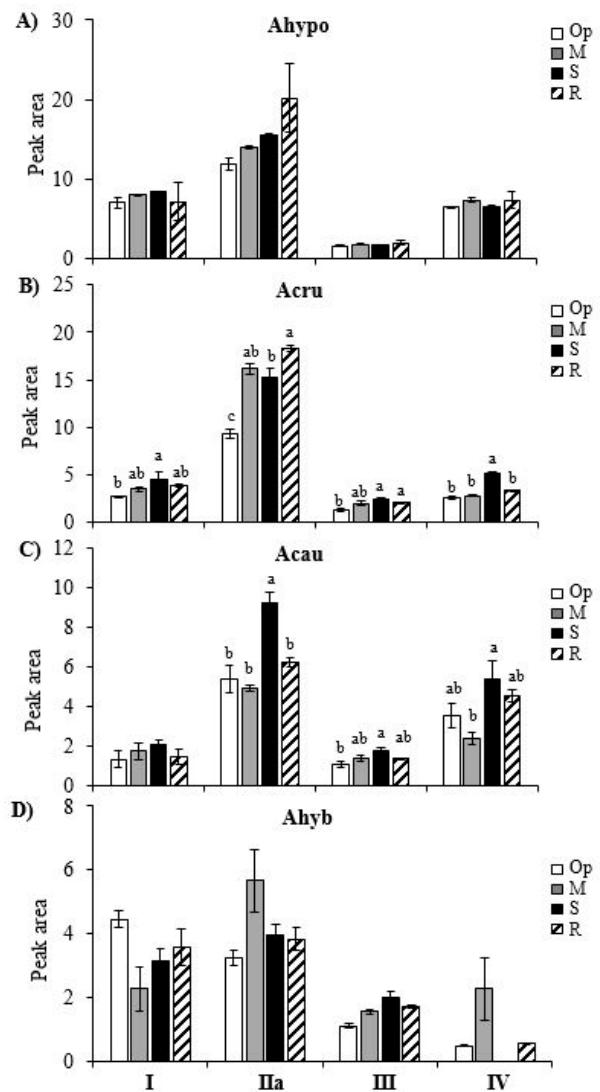

Figure S2. Unidentified RFO-like compounds quantified by HPAEC-PAD in leaf extracts of four species of amaranth plants. (A) *Amaranthus hypochondriacus* [Ahypo], (B) *A. cruentus* [Acru], (C) *A. caudatus* [Acau], and (D) *A. hybridus* [Ahyb]) growing in optimal conditions (Op; empty bars), subjected to moderate (M) or severe (S) water deficit stress (gray and black bars respectively) or allowed to recover from S, 1 day after normal watering was restored (R; striped bars). The unidentified compounds analyzed, possibly RFO with increased degree of polymerization, are labelled in Roman numerals in ascending order in correspondence with their longer elution times, as follows: peak I (16 min); peak IIa (21.2 min); peak III (31.4 min) and Peak IV (33.8 min). The bars represent peak areas. Different letters over the bars represent statistically significant differences at $P \leq 0.05$ (Tukey Kramer test). Bars and error bars indicate mean values and ES, respectively ($n = 3$ pools of four plants each). The results shown are those obtained from a representative experiment that was repeated in the spring-summer and summer-autumn seasons of 2014, respectively, with similar results.

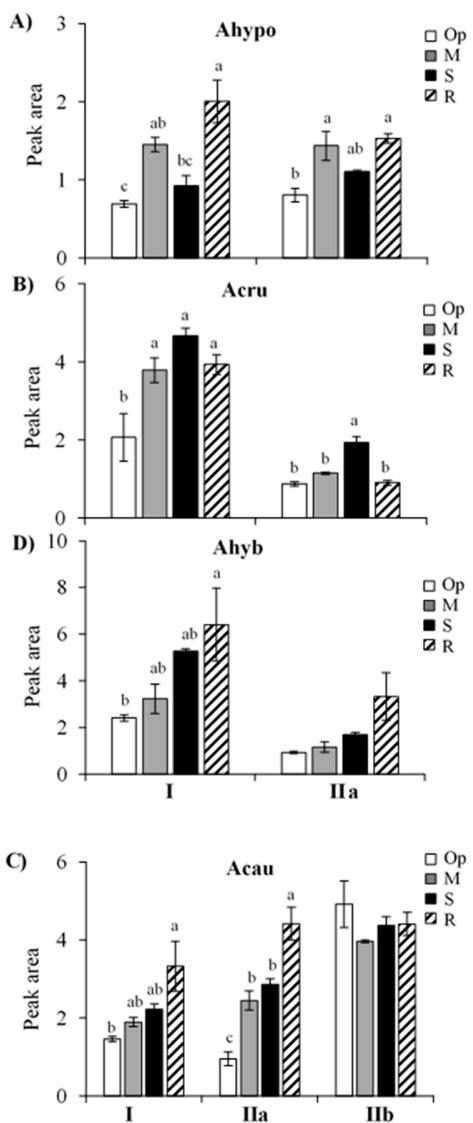

Figure S3. Unidentified RFO-like compounds quantified by HPAEC-PAD in root extracts of four species of amaranth plants. (A) *Amaranthus hypochondriacus* [Ahypo], (B) *A. cruentus* [Acru], (C) *A. caudatus* [Acau], and (D) *A. hybridus* [Ahyb]) growing in optimal conditions (Op; empty bars), subjected to moderate (M) or severe (S) water deficit stress (gray and black bars respectively) or allowed to recover from S, 1 day after normal watering was restored (R; striped bars). The unidentified compounds analyzed, possibly RFO with increased degree of polymerization, are labelled in Roman numerals in ascending order, in correspondence with their longer elution times, as follows: peak I (16 min); peak IIa (21.2 min), and Peak IIb (22.8 min). The bars represent peak areas. Different letters over the bars represent statistically significant differences at $P \leq 0.05$ (Tukey Kramer test). Bars and error bars indicate mean values and ES, respectively ($n = 3$ pools of four plants each). The results shown are those obtained from a representative experiment that was repeated in the spring-summer and summer-autumn seasons.

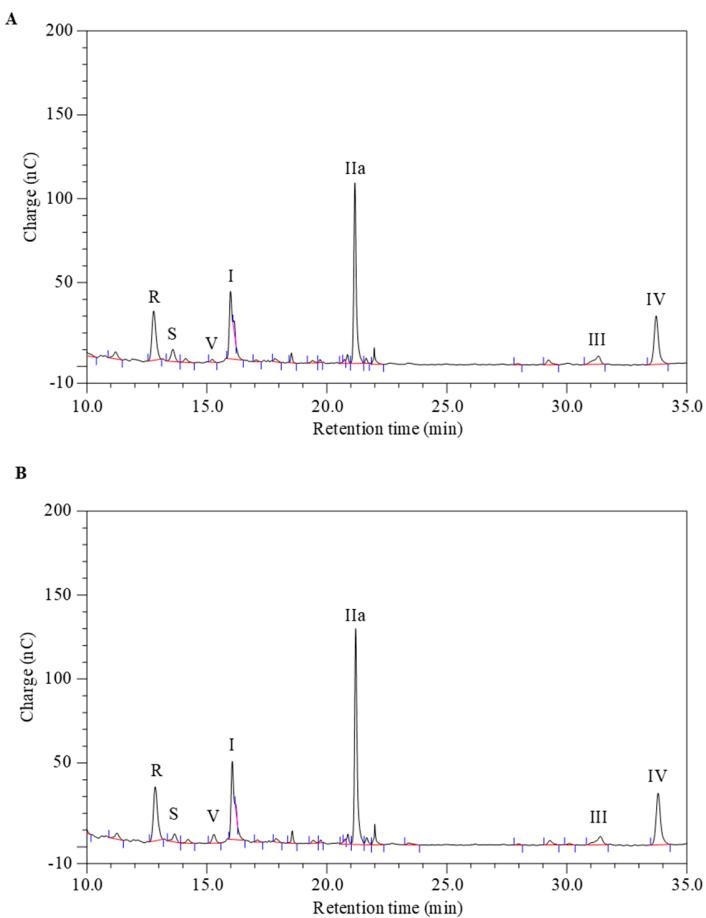

Figure S4. Representative HPAEC-PAD separation of soluble raffinose family oligosaccharides (RFOs) and unknown RFO-like compounds extracted from leaf extracts of *Amaranthus hypochondriacus*. The traces were obtained from plants growing in (A) optimal conditions or (B) subjected to severe water deficit stress. The peaks shown correspond to known raffinose (R), staquiose (S) and verbascose (V) oligosaccharides. Unknown RFO-like compounds were labeled with Roman numerals assigned according to their increasing retention time: I (16 min), IIa (21.2 min), III (31.4 min), and IV (33.8 min).

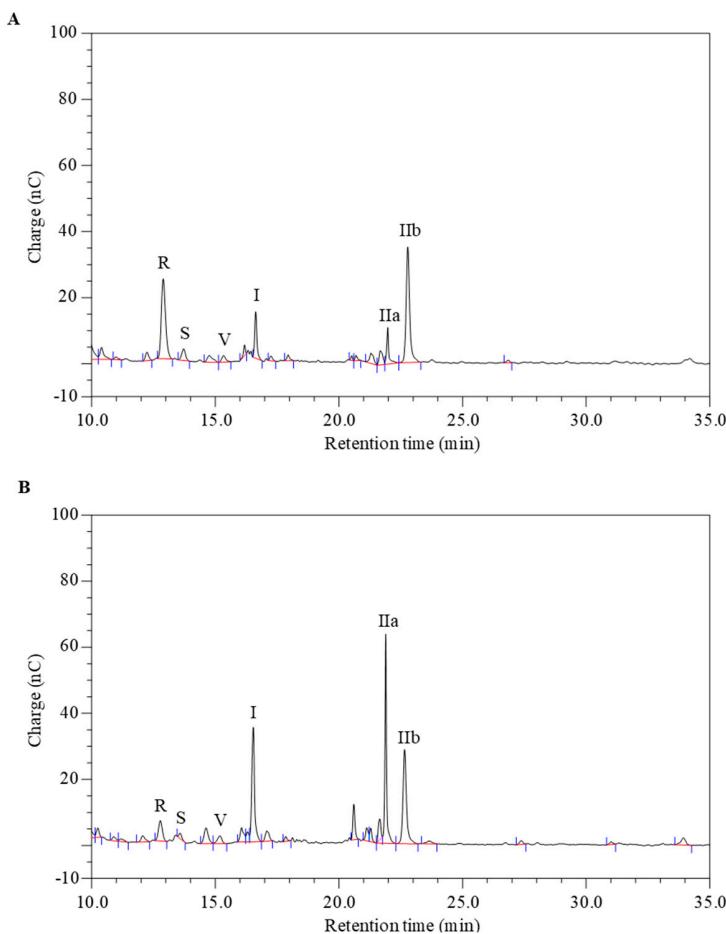

Figure S5. Representative HPAEC-PAD separation of soluble raffinose family oligosaccharides (RFOs) and unknown RFO-like compounds extracted from root extracts of *Amaranthus hypochondriacus*. The traces were obtained from plants growing in (A) optimal conditions or (B) subjected to severe water deficit stress. The peaks shown correspond to known raffinose (R), stachiose (S) and verbascose (V) oligosaccharides. Unknown RFO-like compounds were labeled with Roman numerals assigned according to their retention time: I (16 min), IIa (21.2 min), IIb (22.8 min).

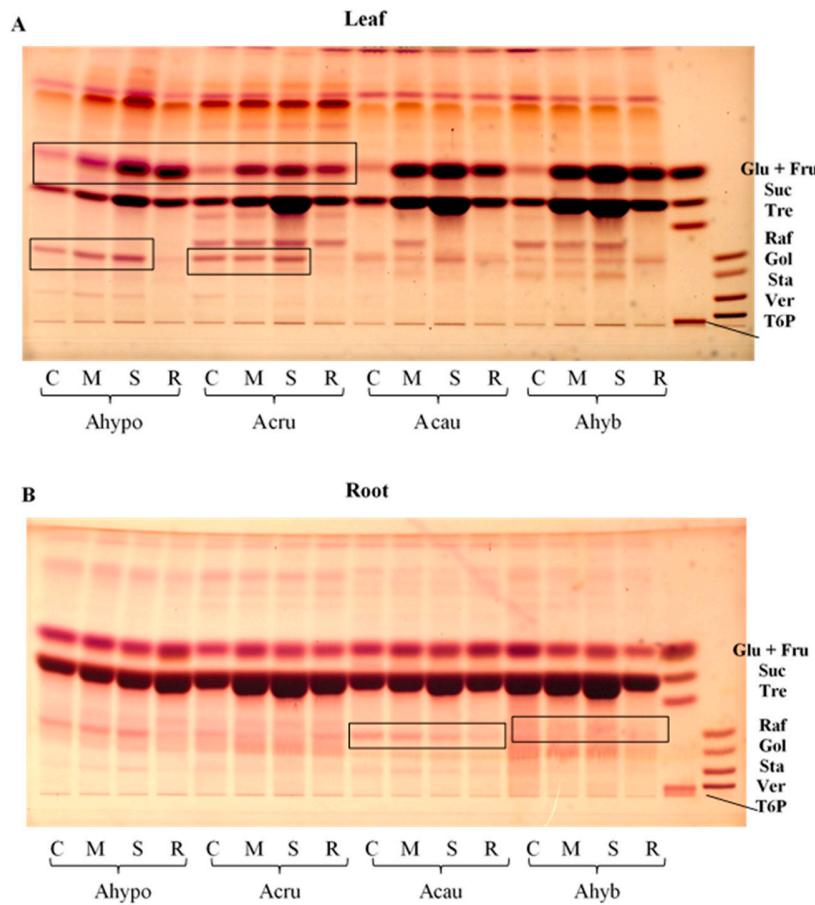

Figure S6. Thin layer chromatography separation of soluble non-structural carbohydrates and raffinose family oligosaccharides (RFOs). These were extracted from **(A)** leaves and **(B)** roots of four species of amaranth plants: *Amaranthus hypochondriacus* [Ahypo], *A. cruentus* [Acru], *A. caudatus* [Acau], and *A. hybridus* [Ahyb]) growing in optimal conditions (Op), subjected to moderate (M) or severe (S) water deficit stress or allowed to recover from S, 1 day after normal watering was restored (R). The position of the RFO and their respective precursor standards are shown in last two lanes on the right edge of the plate: These were the following: galactinol (Gol), raffinose (Raf), staquiose (Sta) and verbascose (Ver). Also included were glucose + fructose (Glu + Fru), sucrose (Suc), trehalose (Tre) and trehalose-6-phosphate (TGP) standards. Unidentified compounds, perhaps representing unknown RFOs that were constitutively accumulated in these tissues and/or were further increased in treated plants are enclosed in boxes.

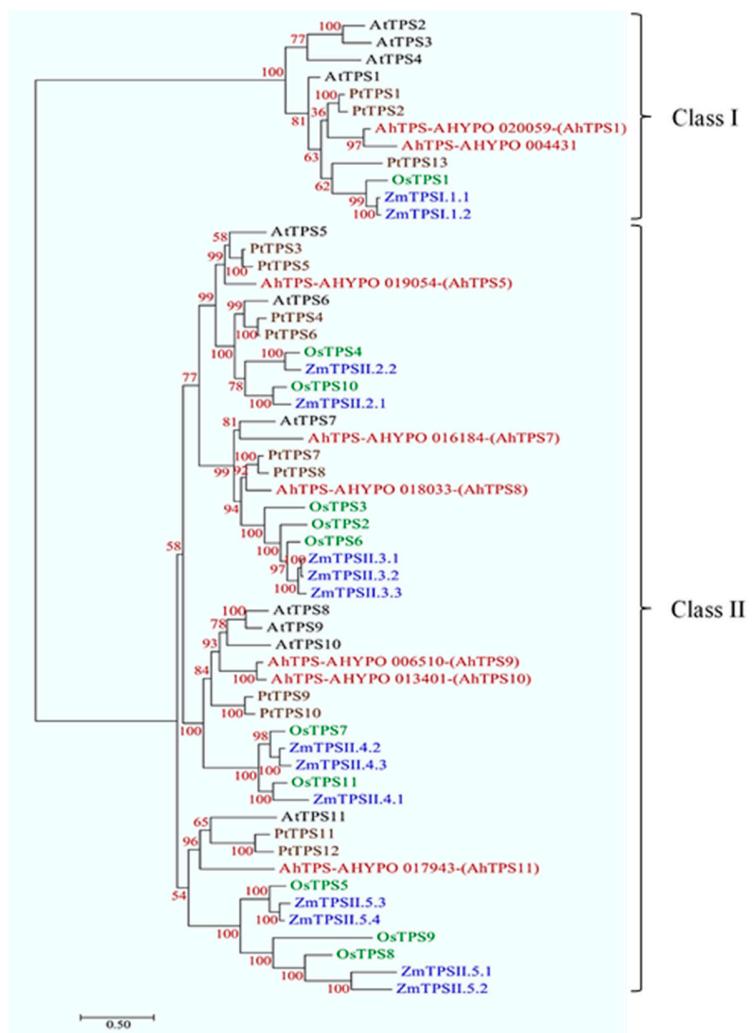

Figure S7. Phylogenetic analysis of the class I and II trehalose phosphate synthase proteins. The AhTPS proteins, shown in red text, were obtained from their respective genes, themselves contained in the *Amaranthus hypochondriacus* genome (Clouse et al., 2016). The phylogeny of AhTPS proteins with members reported in other plant species is shown. Abbreviations used are the following: Ah, *Amaranthus hypochondriacus*; At, *Arabidopsis thaliana* (black text); Os, *Oryza sativa* (green text); Pt, *Populus trichocarpa* (brown text), and Zm, *Zea mays* (blue text). The tree was obtained using the maximum likelihood method.

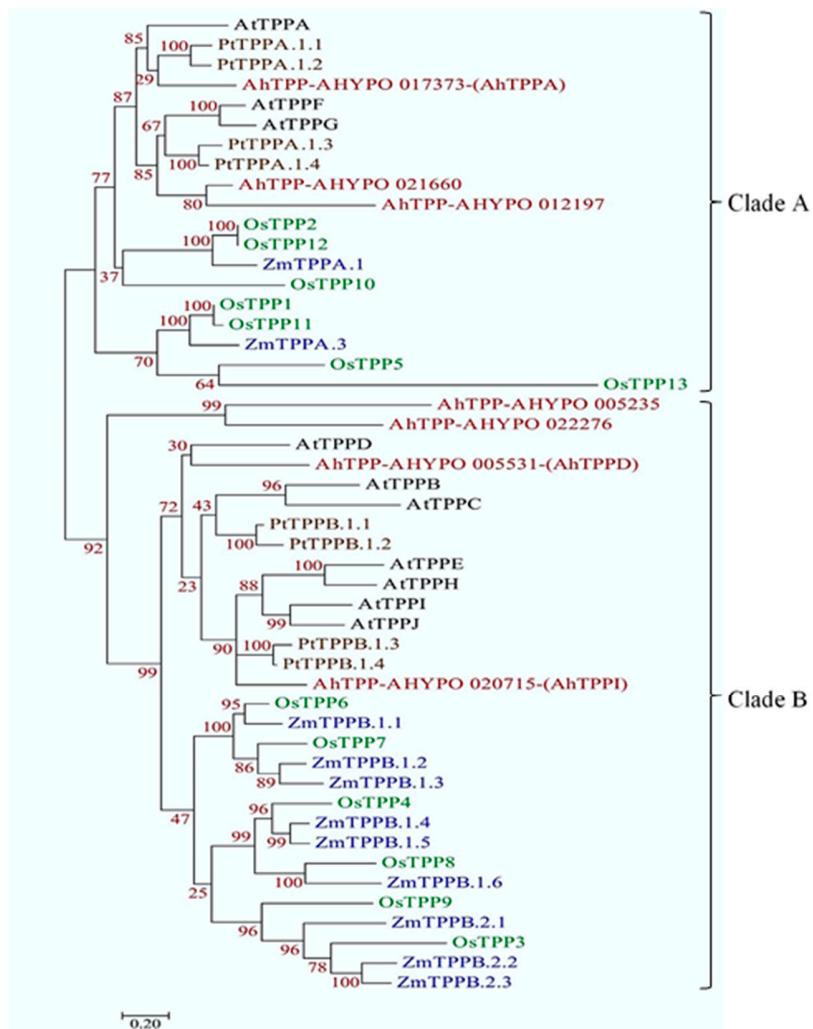

Figure S8. Phylogenetic analysis of the amaranth trehalose phosphate phosphatase proteins. The AhTPP proteins, shown in red text, were obtained from their respective genes, themselves contained in the *Amaranthus hypochondriacus* genome as reported by Clouse et al. [31]. The phylogeny of AhTPP proteins with members reported in other plant species is shown. Abbreviations used are the following: Ah, *Amaranthus hypochondriacus*, At, *Arabidopsis thaliana* (black text); Os, *Oryza sativa* (green text); Pt, *Populus trichocarpa* (brown text), and Zm, *Zea mays* (blue text). The tree was obtained using the maximum likelihood method.

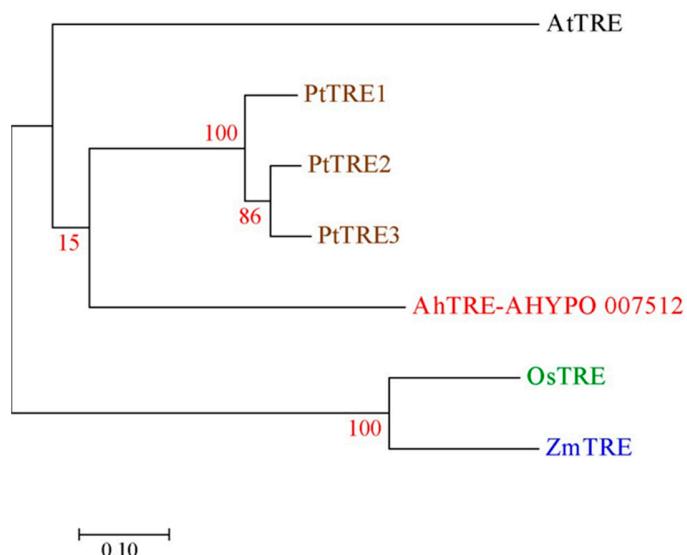

Figure S9: Phylogenetic analysis of the amaranth trehalase protein. The predicted AhTRE protein, shown in red text, was obtained from its respective gene, itself contained in the *Amaranthus hypochondriacus* genome as reported by Clouse et al. [31]. The phylogeny of the AhTRE protein with members reported in other plant species is shown. Abbreviations used are the following: Ah, *Amaranthus hypochondriacus*; At, *Arabidopsis thaliana* (black text); Os, *Oryza sativa* (green text); Pt, *Populus trichocarpa* (brown text), and Zm, *Zea mays* (blue text). The tree was obtained using the maximum likelihood method.

Table S1. Relative expression levels¹ of selected *SnRK*, *SnGRIK* and *SnRK2* genes in amaranth leaves. Gene expression was determined in leaves of four *Amaranthus* species subjected to two levels of water-deficit stress (moderate [M] and severe [S]) and to subsequent recovery ([R]). Induced (normalized expression values ≥ 2.0; in normal text) and repressed (normalized expression values ≤ 0.5; in italicized text) expression values are emphasized in bold.

Gene	<i>A. hypochondriacus</i>			<i>A. cruentus</i>			<i>A. caudatus</i>			<i>A. hybridus</i>		
	M	S	R	M	S	R	M	S	R	M	S	R
