**Figure S1.** Cultivation of *O. sativa* 'Nipponbare' plants in pots with 0 and  $2 \times 10^9$  cells/mL *P. putida*. The images were taken 2 days after the bacterial treatment.

**Figure S2.** HPLC-based analysis of labelled ACC in the medium of *P. putida* treated rice plants. The labelling was carried out using the Marfey's reagent. HPLC conditions: reverse phase HPLC (Agilent 1200 Series, United States) at 350 nm using an Eclipse XDB-C18 column (250 × 4.6 mm, Agilent) at 35 °C. The mobile phase was 0% to 60% CH<sub>3</sub>CN in H<sub>2</sub>O from 0 to 60 min, 90% CH<sub>3</sub>CN in H<sub>2</sub>O from 60 to 70 min, and 0% CH<sub>3</sub>CN in H<sub>2</sub>O from 70 to 75 min (column temperature: 30 °C; injection volume: 5 µL).

**Figure S3.** HPLC-based analysis of ABA in rice leaves.

HPLC conditions: reversed phase HPLC (Agilent 1200 Series, United States) at 270 nm using an Eclipse XDB-C18 column ( $250 \times 4.6$  mm, Agilent). The mobile phase was 5% to 50%  $\text{CH}_3\text{CN}$  in  $\text{H}_2\text{O}$  from 0 to 30 min, and 5%  $\text{CH}_3\text{CN}$  in  $\text{H}_2\text{O}$  from 30 to 40 min (column temperature: 30 °C; injection volume: 20  $\mu\text{L}$ ).
