

Supplementary information

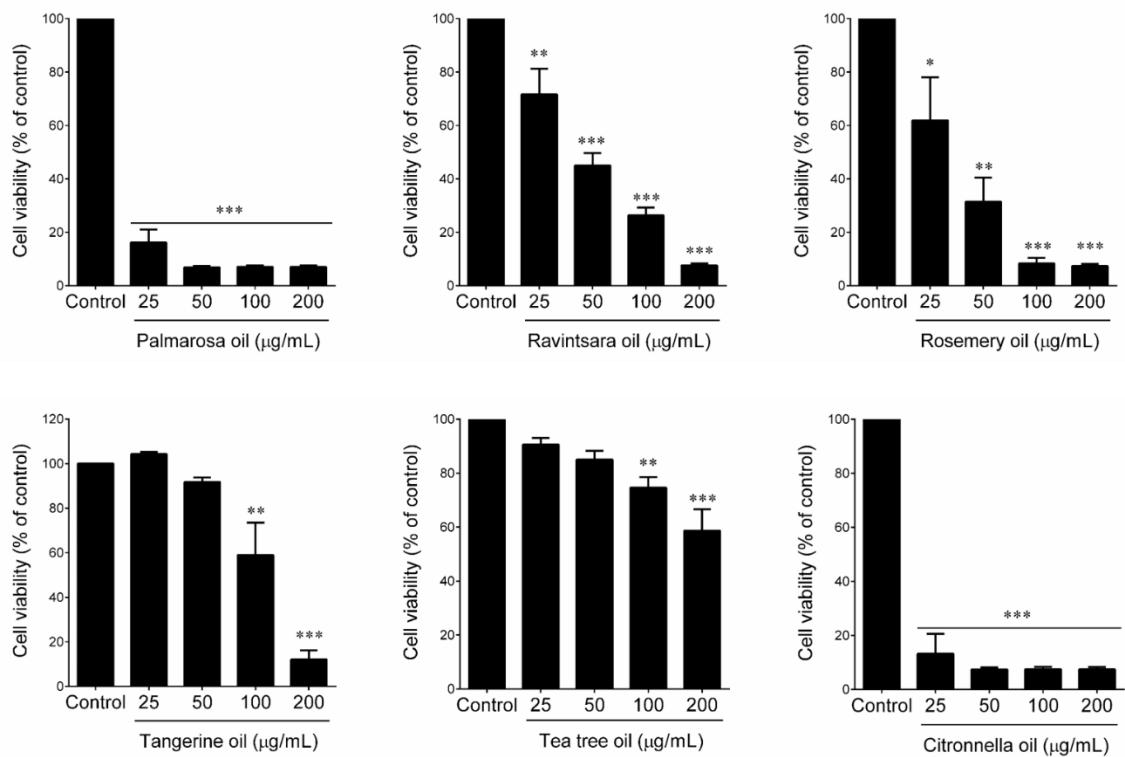

Figure S1. Cytotoxic effects of essential oils on HT-29 cells. HT-29 cells were incubated with increasing concentrations of essential oils (25–200 $\mu\text{g/mL}$) for 48 h. The cell viability was determined by the MTT colorimetric assay as described in materials and methods. Values represent the mean \pm SD of three independent experiments. P values of less than 0.05*, 0.01**, and 0.001*** were considered statistically significant for the sample treatment group *vs.* the control group.

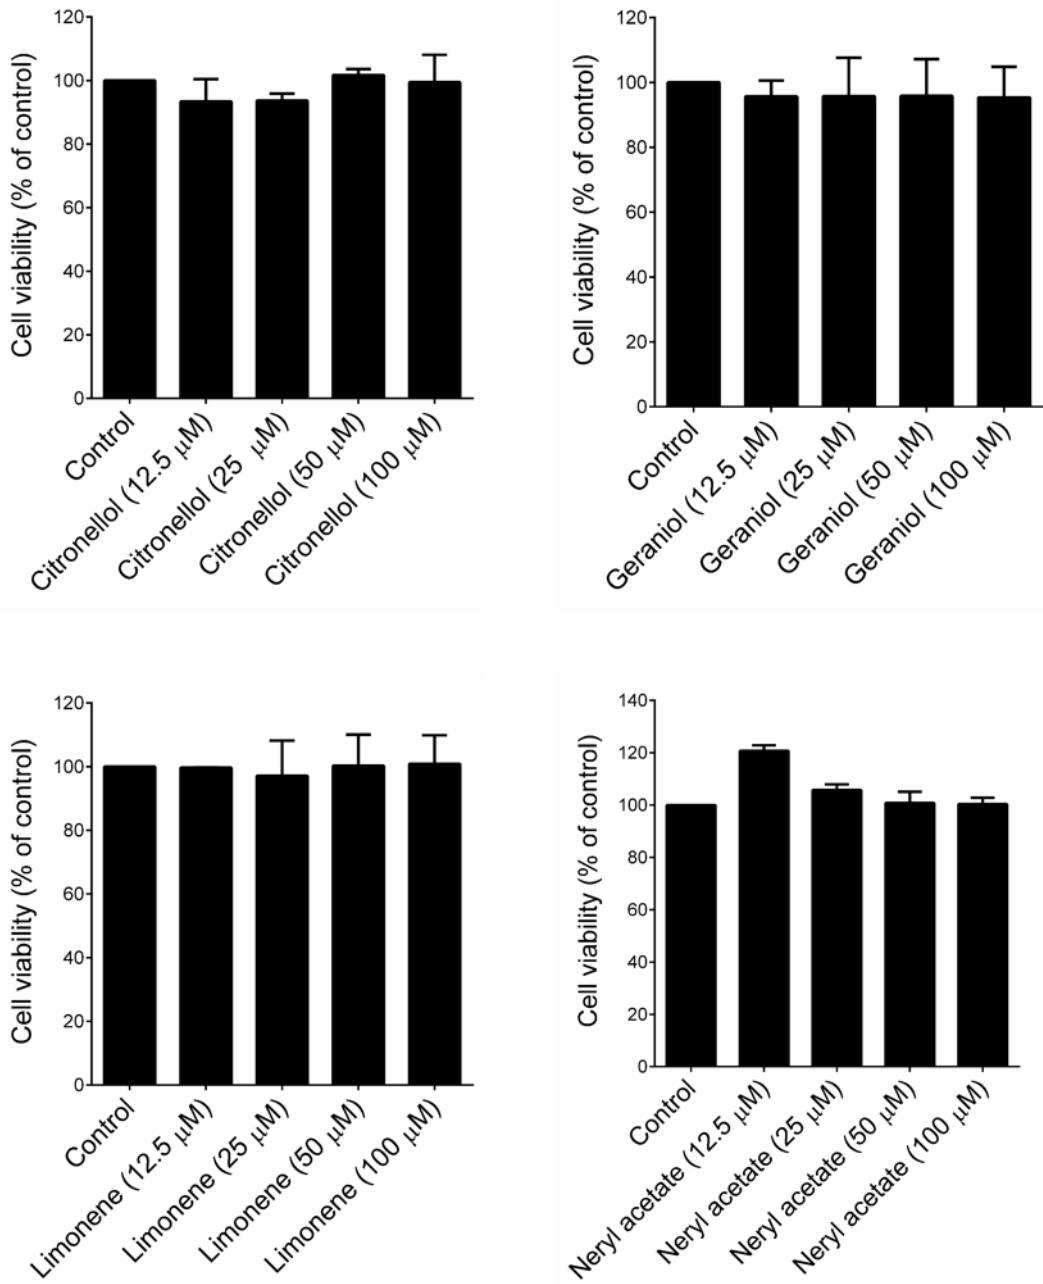

Figure S2. Cytotoxic effects of major compounds in geranium and lemon essential oils on HT-29 cells. HT-29 cells were incubated with increasing concentrations of pure compounds (12.5–100 μ M) for 48 h. The cell viability was determined by the MTT colorimetric assay as described in materials and methods. Values represent the mean \pm SD of three independent experiments.

Table S1. Main components and their relative contents (%) of Bergamot oil derived from citrus rind (peel) of *Citrus bergamia*.
