Figure S1: HPLC-PDA-MS/MS profiles of *E. angustifolia* root extract and the commercial standards. A: PDA profile of the *E. angustifolia* root extract ($\lambda=254\text{nm}$) and echinacoside, dodeca-2E,4E,8Z,10E/Z-tetraenoic isobutylamide and cynarin standards. B: ESI⁺ and ESI⁻ mass spectra of echinacoside commercial standard acquired in scan mode, C: ESI⁺ and ESI⁻ mass spectra of dodeca-2E,4E,8Z,10E/Z-tetraenoic isobutylamide commercial standard acquired in scan mode, D: ESI⁺ and ESI⁻ mass spectra of cynarin commercial standard acquired in scan mode.

Figure S2: Principal Component Analysis (PCA) score plot of individuals belonging to 48 *E. angustifolia* accessions based on the cynarin, echinacoside and dodeca-2E,4E,8Z,10E/Z-tetraenoic isobutylamide percentage content as variables.

Figure S3: Principal Component Analysis (PCA) score plot (A: PC1 vs. PC2, B: PC1 vs. PC3, C: PC2 vs. PC3) of 41 authentic *E. angustifolia* accessions. Mean values of cynarin, echinacoside and dodeca-2E,4E,8Z,10E/Z-tetraenoic isobutylamide percentage content were used as variables.

Figure S4: Box plots relative to cynarin (A), echinacoside (B) and dodeca-2E,4E,8Z,10E/Z-tetraenoic isobutylamide (C) mean content (%) in 41 authentic *E. angustifolia* accessions.

Table S1: Agronomic features for the investigated *E. angustifolia* accessions

Table S4: Pearson's correlation matrix between cynarin, echinacoside and Dodeca-2E,4E,8Z,10E/Z-tetraenoic isobutylamide % quantitation results (%) and morpho-quantitative variables.

Values in bold type differ from 0 at a significance level $\alpha=0.05$
